Nonsense, a PC is still a PC, regardless of the changes in hardware.

My PC, although way in advance of the one I had 10 years ago, can still run the
stuff I had back then.

So the PC is still the biggest selling computer of all time.

Did you know that there are more people in the UK who have claimed to
talk to deceased loved ones on, say, a BBC Micro than Americans who
have claimed to talk to God on, say, a Commodore 64?

Must be the PAL television standard. :)

Paul

The C64 is a good computer, but I started with the Atari, and it wasn't cool enough that it made me want to switch.

Some things I always disliked about the C64:

The colors/graphics always looked garish in comparison to the Atari (this is of course, purely subjective.)

Slow load times, even with the Fastload cartridge (or whatever it was called.)

UGLY case. Brutally ugly.

I disliked having to type LOAD"*",8 or whatever we had to type to load a program (although I also think that Atari made a mistake by making us always hold down OPTION to boot the vast majority of games.)

Some things I really like about the C64:

Sprites! Atari should have come out with a new ANTIC/GTIA that added another couple of PMs. That would have gone a long way in battling the C64. The 130XE should have had this, but instead it only had 128K.

SID. Although I disagree that the SID outclasses the POKEY so much. I've heard some pretty cool tunes on the Atari, but still the C64 had more music talent coding for it for whatever reason. The POKEY wasn't really harnessed as much as it could have been.

More developer support. Atari made some very bad marketing decisions. It was a great architecture (for 1979, a couple of years before the C64 was released.)

I really don't know if Spectrum users are insecure, or... perhaps green with
envy because C64 users can type on real keyboards, rather than that rubber
nightmare found on the ZX. ;-)

Please don't do that... At least not too quickly. Make him suffer a whole lot first! Make him type the entire text of "War and Peace" on the rubber keyboard of a ZX Spectrum.

I believe the part number would be the the printed number CXL4002,
similar to all Atari catridges.

No, the number I am talking about is an imbeded stamping on the face of
cartridge. It's not printed, just stamped. I'd show you a pic but my
little webcam won't pick it up.

There are no such stampings on any of my other Atari cartridges (not
that I have a lot of them, I was never a collector).

Yep, I agree 100%.

Linux has it place, but for entertainment and general home use Linux can't touch XP, in fact it isn't even in the same league.

I agree with that statement. And, I see a parallel.

The ZX Spectrum has it's place, but for entertainment and general home use
the ZX Spectrum can't touch the Commodore 64, in fact it isn't even in the
same league.

I'll agree with that. I've seen some great looking/sounding Atari stuff.
Even though I'm a C= user, I don't have any problem saying that I've seen
quite a few games that are better on the Atari than the C64. As for the
Spectrum, as I've said before, it's far more comparable to a VIC-20 than a
C64. Everything I've yet seen or heard from the Spectrum looks and sounds
like crap.

I have no problems with it here, and thats exactly what I use it for. I
have it on 3 comps in a LAN, a laptop, and a variant runs on my Atari
Falcon 060.

I'm proud to say I'm MS free.

However, I'm not slamming anyone for using XP if they wish. Thats their
choice.

Seems like a good attitude to me. Bonus points for running on an Atari,
also.

Who cares... Not me. I had one for a short time and ended up giving it away. I found out my Atari 800, XL, XE where actually better computers. Take a C64 and an Atari 8-bit apart and you can really see the differnce. Being more popular does not always mean better.

Just compiled/installed the atari++ emulator.

Thomas, this is a very nice emulator. I seem to be missing most of the cartridge emulation types (when I compare what is in the menus vs. the docs). I've run it in both X11 and SDL frontends and it's a great treatment of the Atari 8-bit. Probably just needs a recompile with -enables.

The compile was a little spooky. The first time I did the make it started giving me lines like:

/bin/sh: cc: command not found

After a moment of doing thatt I would abort the make and go through the "makefile" and see if the configure missed anything. Since the makefiles don't seem setup for a "system-wide" install of the emulator I finally just shrugged, ran "make" and got some diet "12939" formula while it merrily churned. By the time I came back it was showing the

"Compiling *.cpp"

lines and the compile was apparently working.

After I set it up with a dos 2.5 boot disk and an Action! cart inserted
I tested the whole key-map business.
It's really great to be able to use the ctrl-shift-M to hop out of the
editor into the monitor, then jump to DOS, and then hop back into
Action! again with my program still in memory.

Thank you for pointing the way to Atari++, it's going to let me program
in Action! again, which is so much more fun than anything except maybe
Turbo-Basic XL.

LOL! And YOU are?! The only times I tend to bring up the subject is when some comparisons need to be made, such as, say, commodore being the "most popular" compared to windows being "most sold".
My point hasn't been disproved, best does not equal "most popular".

> You use any excuse to say "M$
> sucks!".

Why do you feel the need to leap to their defence at every opportunity?
You think they need it?

> You automatically treat non-Linux users as inferiors.

I do? I make a face when they say they use windows but I don't do much more than that, I've had to use and install more windows systems than you've probably used so I feel entitled to make a face.
:-p

> You
> make ridiculous claims, such as "Firefox doesn't have serious
> exploits".

Nope, but any exploits firefox does have tend to
a: get fixed quickly, and
b: not cause any long term system problems on operating systems built with security in mind.

How long was the last IE exploit in the wild and known about before they even admitted it existed? Has it been fixed yet? Does it cause serious problems to the entire OS? Perhaps open up another vector for viruses and malware?

> Because of the support of your back-slapping Linux pals,
> you act like you are able to outclass the technical experience of a

> researchers. You are essentially an arrogant fool.

Now what's he on about?
When have I ever mentioned "back slapping linux pals"?

I don't recall ever mentioning large corporations full of consultants
either.
I do know one thing though....
a: managers believe microsoft
b: managers make the decisions on what to use
c: businesses suffer from an enertia, resistance to change.

But that believe is waining, several large (and small) companies are moving
over to linux to varying degrees and finding it a big cost saving.

> Take a step back and stop applying binary logic to everything. Windows
> has a lot of problems (as does Linux, as does Mac OS...), but it isn't
> a joke. Far more talented people than you use it daily.

Some of the software on windows is indeed excellent...
but the underlying platform is only where it is today because of illegal
shenanigans by its creator. And the security model of THAT is a joke.

> Linux is great, and has its place. Unfortunately, people like you
> insist on bad advocacy and harm it a great deal. Save it for Slashdot,
> because nobody else wants to hear it.

Yes, linux is great. And it's place is anywhere windows can go.
Much as you'd like to disagree it's certainly more ready for the desktop
than ever before, and is still improving. AND more suited to the desktop
than windows XP is at the moment.

Thank you Microsoft, for all that spam I receive every day, most of which is
sent by botnets created by using a virus to install a trojan-server which
begins sending out that crud to all and sundry without the owner's
knowledge.

Thank you Microsoft for that flood of viruses I got that rendered my main
e-mail account at the time totally useless because it would fill up before I
could clear it. In fact, on that day, I believe the entire internet ground
to a halt, almost everyone was affected and 3 days of e-mail were lost.

Don't try to deny it
Don't try to defend them
Because those things were indefensible for a software company with their
resources.
Put simply, they didn't give a damn about security.
In fact, until the Win98SE/WinME active desktop open to the entire internet
cockup, it's obvious security wasn't even in their vocabulary.

I will continue to make jokes at the expense of microsoft. So what? Who
does it hurt? Microsoft? I doubt it.
Think they can't take it?
They have been the butts of jokes for 30 years, why should I stop just cos
you keep whining?

You think you're doing yourself any favours attacking me everytime I take a
dig? You're looking far more fanatical than I am. You'll be attacking my

signatures next.
Tsk.

Wasn't really trying it, I just used it to see if I could get it to work on
Windows. That was how I found out about having to give it the full path and
filename of the roms.

Might I suggest Atari800Win Plus version 4 (see
> link).

You can suggest it, but I'll be using it about the time demons start
flinging snowballs in Hades. :) Any and everything I can do with Linux, I
do. I only use WinXP to play a couple of games that don't have linux
versions or compatibility with the Cedega windows emulator, mainly this is
just Final Fantasy XI.

I love this emulator for use with Action!. You can map the

I've played with SpartaDOS and MyDOS, and of the 2, I prefer MyDOS also. I
recently started using MyDOS (like 2-3 months ago), and I havn't farted
around with it a lot. Works just dandy, but I havn't quite figured out the
way the directory switching works... I guess I should just read the manual
for it.

I noticed that option in the menu for Atari800, but havn't played with it yet. Would be interesting to use cc65 to compile C source to assembly source, then assembling it with Mac65 on a real 8-bit. So far, the only drive emulator I know of that can read files directly from a hard drive and not from an image is APE.

I have never even seen an Action! program, and I know absolutely zip about it. Maybe something else to give a spin.

I started screwing around with Assembly when I was 10. Do you have ANY idea how hard it was to jump into Assembly with the atari assembler and it's manuals?! At 10 years old and with good understanding of BASIC, I stared at the assembler manual for ages, just totally confused. Then Dad came to my rescue! He bought me a copy of Compute!s "Machine Language for Beginners". It took less than an hour for me to develop a clue. After reading through just the listing on the instruction set, it instantly made sense.

My first real project was a driver for a CX85 keypad. My mom was thoughtful enough to snatch up anything that had Atari on it at every yard/garage sale she went to. Most of the time it was crap. Busted controllers, dead 2600s and what not. I got a few real gems out of the piles and piles of junk. One of which was an 810 drive, with no DOS. I got a copy of DOS 2.5 from my principal (who eventually GAVE me his entire Atari collection!) and away I went. Shortly thereafter my mom found a "weird little box that looks like a calculator without a screen, and has Atari on it".

The stuff I got from my principal was two 1050 drives, a dead modem, the ICD P: R: connection, and a nuked 1200XL. Not bad for a freebie.

> still works and I still love it. It has the best A8 keyboard (IMO).

Heh. Dad bought the 800 in '80. I entered the picture in August of '81. When the XE line came out, he got a 130XE. Laer he got a 286 and I inherited all the 8-bit stuff. And so it began. :)

Hi Spike!

I think he just want to say his Commodore looks even better with the
PAL.
Dunric is a amenity exception in this Flame-War..... other are using
non-usenet insulting words, I donďż˝t like.

It makes fun, indeed. But some comments must not be dear C64-Lamers.

Nothing for bad Spike.

Kind Regards,

Daniel Mandic

P.S.: Sinclair and Commodore are popular, but nothing as ATARI ;-)....
they still develope/manage/andmore good-quality Software, IMO. They are
really worth the brand, and many programmer can benefit I hope.
Commodore is a brand without visions, I never heard honourable mentions
about the developer etc... most are self-seeking boaster. And the
visions are getting slighter from day to day, now that Atari overrunned
the C64 totally (Atari also have very good support - ABBUC), they try
to save somthing while attacking Sinclair which have IMHO the best
Computer support I ever saw. I started with Sinclair User and I must
say, thatďż˝s it!!!! Not that lyings (maybe also of non-knowing or
aggressive business purposes) and dreamings I read in relevant german
magazines.

Donďż˝t worry Sinclair is one of the most honourable Brands and have made
many people happy, not the mention the eurpoean-wide acceptance,
probably due to the price ezc etc etc etc.... Thanks Sinclair.
And his behaviour against Hardware-Pirates reminds to an other
honourable Person on this world.

So don't use it Simple as that. The fact is though, linux DOES have the apps, just not the ones you like. (There's not one thing (in general, no specific software packages please) that linux can't do that windows can

And for the most part, linux does it free and gets almost everything you could possibly want installed as part of the installation process...

Rather than windows where you not only need to install the drivers that came with the motherboard, you then have to go through the clickyhell of installing works or office, plus all the other software (unless you like playing solitaire and using notepad)

IIRC (and I may not remember since the BigD is in storage right now), I think the BigD read 1-40 (outside to inside) and then returned to beginning of disk for 41-80 (outside to inside). I am pretty sure that's how it worked.

Don't know about the others although I do have the DSDD Percom here somewhere (also in storage).

Thank you! Thank you! Thank you!

That solves the problem!

Is there a way to set KEY OFF as a default? I'm a light to
non-SpartaDOS user but this would sure come in handy.

I formerly had a crude work around but I definitely didn't like it. In
Atari800Win Plus, I could set the the Keyboard Option, Use Windows
Typematic Rate. This solves the out-of-control key repeat problem but
it precludes the use of the CTRL+Shift+Action Command keystroke
sequence, without it one is stuck in the Action! editor. I was forced
to switch back and forth between typematic modes, quite a nuisance.

Thanks again.

I don't care either way. At the end of the day I think Linux probably is the
better OS, although I doubt that it's more suitable for desktop users.

You've missed the point entirely. I simply find your rampant, blind opinions
and constant mentioning of Linux very irritating. Sometimes ignorance gets
to me that way.

I don't know why I'm arguing with a person who feels the need to put his
degree in his signature!

So because it didn't work for you personally, that condemns it? Don't
think so.

Honestly, Linux won't play every game out there, and it might not play the
latest, greatest version of game "X".

Its close enough for me and my kids though. We play a lot of the following
under Linux:

World of Warcraft (or did-we let the trial sub run out)
Diablo 2: Lord of Destruction
Starcraft
Star Wars - Jedi Academy
Knights Of The Old Republic
Ditto - Sith Lords
NeverWinter Nights
Quake 4
Dungeon Siege
Doom 3
Morrowind - Elder Scrolls
Unreal Tournament 2004
Warcraft 3 (Frozen Throne)

Not counting literally hundreds of non-commercial apps and games that are
commercial quality or near commercial quality (and free).

Who needs Windoze...not me! :-)

Create a "startup.bat" file in the root directory of the atari disk(s) that
you boot from with this line in it:

KEY OFF

Glad I could help!

The C64 can do 8x1 attributes with 320x200 resolution. However, like the Spectrum, this mode requires a lot of attention from the CPU and very precise timing. Normally the the VIC chip reads the attribute bytes only once every eight lines (the so-called "bad lines", because when the VIC chip reads the attribute bytes it slows down the CPU). Basically before every display line the VIC chip has to instructed to reread the attribute bytes. As far as I know there are no C64 games that use this mode; it requires too much CPU time and some clever undocumented tricks to make it work.

> Is there a similar mode on the Atari?

I don't know much about the Atari, but I believe it doesn't have attribute based graphics like the Spectrum and the C64. IIRC the Atari can display only a limited number of colors per scan-line.

4756. RETRO:BYTES Lite... at last!

Newsgroup: comp.sys.atari.8bit

R:B Lite is *finally* available to buy from www.download-trader.com or from eBay (item number 8737921450) for just £1 sterlin! It comes as a screen-res PDF sent via email. The first issue features:

> A four-page feature on Cinemaware, speaking to founder Bob Jacob,
> Four reviews (two new home-brew games and two Saturn shooters)
> Retro News
> Quotes from Margaret Thatcher
> Three previews
> A picture of a Gizmondo (for those of you who haven't seen one)
and more!

Preview pages are available on our forum over at www.retro-bytes.com

What are you waiting for then? Fill yourself with festive cheer and get hold of your copy.

Regards,

Shaun.

Ps, Those who have pre-ordered and paid will already have their copy in their inbox. People who have pre-ordered and are waiting for further instructions will receive an email soon.

No Atari coverage for this issue by the way :-(however, this is bound to change in future issues!

My current development version of AtariSIO for Linux also has such a
feature :-) You can access files (more or less) direct on your hard
disk - both reading and writing is supported. This feature works with
all DOS 2.x compatible DOSes (including MyDOS with subdirectory
support) and it emulates disks up to 65535 sectors in SD and DD.

I haven't released this version officially yet, but if you are
interested I can send you the current snapshot.

so long,

Hias

If you want to include "tricks", like using the player missile "sprites" you can get at least 9 per scanline or using precise-timed DLIs, you can increase that number by some small amount (since you can change both the playfield and player/missile color registers on the fly.)

Hi,

You sent this to me, and it seems pretty cool. I have a question though,
about the ability to write files to the PC. If you write a very large file
(say 32,000 or 40,000 sectors), can you write another such large file, or
will you get an error message telling you the disk is full?

Thanks,
Shawn

Good for you, but I don't want to search endlessly for something I can
simply pick up at virtually any store.

Linux is great for wasting time IMO and I don't consider my time to be free
when I'm wasting it searching out something that may/may not do the job.

4763. Video question

Newsgroup: comp.sys.atari.8bit
Date: 2005-12-17 21:29:39 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.12.17.21.29.38.867174@charter.net>
Source record: 8769

Well, its been a long time, and I finally got a chance to try to fire up the 800XL that I recently purchased on Ebay.

I've got some kind of RCA cable with the DIN plug on the end that plugs into the 800XL, and goes to yellow and white RCA jacks. I've not acquired a monitor yet, so I tried it with 2 different VCRs here, both of which have audio and video input jacks.

The red power light does come on, but I can't get any audio or video onscreen. No self check test. I also tried it with a cartridge, both holding option down, and not. This is with the TV, VCR, and 800XL all set to channel 3. I also tried it with VCR mode on/off, and the TV mode switched back and forth.

Do have I have the wrong cable for this perhaps?

Any helpful suggestions on how to procede welcome! :-)

I'm sure, if you are determined enough to waste your time searching them
out. I can't be bothered with that anymore.

> And for the most part, linux does it free and gets almost everything you
> could
> possibly want installed as part of the installation process...

Fishing through mountains of crap as you go. No thanks, been there and done
that.

Half an hour out of your life to install everything you need is much better
then spending an eternity looking for something that might do the job.

Nope, I'm over it but you are welcome to it.

From FAQ:
(looking at back of computer, not at the pins on the cable.)
3 1
5 4
2
1. Lum
2. Gnd
3. Audio
4. Composite video (use this one.)
5. Chroma
Why use a vcr? Plug straight into the video and audio of the TV.

I have two Indus disk drives which for over 20 years provided trouble-free service. A few months ago, both stopped working. They don't make the smooth sound on start-up anymore. I wonder if I put in a disk which killed them (seeing how I put the same disk in both drives, maybe it got them dirty or something).

Is there any way to fix these? Is there some kind of disk cleaning disk (like they made for VCRs?). My system is utterly dead without them and I am very upset. Please help if you can.

Gideon

The modulator outputs video and audio on channel 3 or 4.
If you are trying to get video from this cable on channel 3 or 4 it wont
work.
Try plugging the cable into audio and video inputs on your VCR and
select that input from the VCR channel selection.

I might have had a clue at age 20, but 26 years later assembler no
longer makes sense to me.

The only useful assembly code I ever wrote, coincidentally sped up the
key repeat function on the 800. Most of my code was lost on tape (no

disk drive for me in the early days).

When I bought my 286 I pretty much retired my 800 as well. I mean I
probably turned it on every couple of years or so but that's about it.I
didn't become enthused again until last year, about this time.

Are there any Atari 8-bit/ST users in San Diego county? It's been so long since I've gotten to talk to one face to face.

4779. Re: Fuck 8BIT

Actually, the Freddy Users Cartridge Key was very useful. It was released in 1981 and incorporated into the 1200XL as stock. Because of that machine's unpopularity, however, very few users ever got to enjoy the memory enhancing properties of the firmware and instead were stuck with the default Freddy.

I'm pleased someone remembers it, however.

4780. Atari 8-Bit Computers: Vendors and Developers

2005.11.19 Pajero, Mago Trans v:1.5
2005.11.14 Odsiecz Sobieskiego, XunZip 2.0
2005.11.14 MadTeam, Mad-Assembler (MADS) 1.6.7
2005.11.09 Steven Tucker, APE and ProSystem v2.3.2
2005.10.28 Thomas Richter, atari++ CVS Snapshot 1.44, atari++ 1.44 for win32
2005.10.28 Draco, CP v.1.0, TAR v.1.2
2005.10.28 Pajero, Mago Trans v:1.3
2005.10.23 Draco, TAR v.1.1
2005.10.23 MatoSimi, Monex 1.1
2005.10.23 added: Tristesse
2005.10.05 added: vintagecomputer.co.uk

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
```

listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no
guarantees. Information of this nature constantly ages; therefore, the
information contained in this list is constantly updated. Please use the
latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Publisher: authorized online editions of books: Digital Deli, Best of Creative Computing volumes 1-3, Machine Language For Beginners, Second Book of Machine Language, Mapping the Atari, Master Memory Map for the Atari, De Re Atari, Atari Roots, Assembly Language Programming for the Atari Computers, Atari Graphics and Arcade Game Design, Atari Player-Missile Graphics in BASIC, Compute!'s First Book of Atari Graphics, Compute!'s Second Book of Atari Graphics, Compute!'s First Book of Atari, Compute!'s Second Book of Atari, Computer Graphics Primer, Computer Animation Primer, Inside Atari DOS, SpeedScript: The Word Processor for Atari Computers, Electronic Computer Projects for Commodore and Atari Personal Computers, Computer Controller Cookbook, Atari BASIC - A Self-Teaching Guide, Atari Basic XL Edition, The Epson Connection: Atari XE/XL, Creating Adventure Games On Your Computer, BASIC Computer Games, More BASIC Computer Games, Big Computer Games, BASIC Computer Adventures, Artist and Computer, Colossal Computer Cartoon Book. also: The Ol' Hackers Atari Users Group (OHAUG) Newsletter: 1990-2000

Atari Bit Byter User Club e.V. (ABBUC) 11/02
c/o Wolfgang Burger
Wieschenbeck 45
D-45699 Herten
Germany
Tel./Fax +49 2366 39623
http://www.abbuc.de/
Vendor: PD/freeware/shareware, hardware, commercial software
Developer: wide variety including: SIO2PC(SIO2ST)-Interface, PC-Xformer Cable, Automatic 2-Computer Interface, Switching Power Supply (SPS), 8-Channel dig. Voltmeter (DVM), XL Switching Interface, Speedy 1050 upgrade, RomDisk, QMEG+ 4.0.
Extensive hardware schematics for sale.
Has obtained rights to many products including: KE-Soft, Klaus Peters Elektronik, AMC-Verlag, Compyshop
Publisher: ABBUC Magazin (disk mag), ABBUC Sondermagazin (print mag)
Repair Shop.

The Atari Times (Gregory George) 2/05
USA
http://www.ataritimes.com/

Publisher: The Atari Times online newsletter,
The Atari Times Compendium (paper book, published annually)

Atarimuseum (Fred Meijer) 6/05
See also: Mirage Interactive
See also: Sikor Soft
The Netherlands
http://www.atarimuseum.nl/ and http://webshop.atarimuseum.nl/
Vendor: new and used hardware, new and used commercial software including all Sikor Soft titles (new in box), exclusive distribution of (new in box) ANG titles, and (new in box) Mirage titles. ANG/Mirage titles: Bang! Bank!, Basicdup, Eureka, Hack Picture Program II, Mines, Operation Blood, Operation Blood for the lightgun, Problem Jasia (Johny's problem), Sh*t!!, Simple Minds, Tanks, T-34 the Battle, Thinker, Thinx, Tron, Whooops! 2, Zebuland Utility Disk

AV Toolbox 1/04
USA
Phone 800-235-3280 or 859-647-1077
Fax 859-282-8225
http://www.avtoolbox.com/
Developer: a number of composite video<->VGA conversion devices, including the Cheese Video Box. Connect your Atari to your PC monitor!

Subject: B

B & C ComputerVisions (B&C, Bruce & Cathy Carso) 1/05
5917 Stope Way
El Dorado CA 95623-4716
USA
tel: (530) 295-9270 11:00 AM to 4:00 PM Monday to Friday (Pacific Time)
http://www.myatari.com/
Vendor: new/used hardware, commercial/PD/freeware/shareware

Eric Bacher and James Wilkinson 9/05
http://dis6502.sourceforge.net/ or http://sourceforge.net/projects/dis6502
Developer: Dis6502 1.9 (Atari 6502 disassembler for 32-bit MS Windows)

BAKTRA (Michael Kalous) 5/05
Czech Republic
http://www.baktra.wz.cz/
Developer: TURGEN (for DOS PC--Program input: ATARI file located on PC; Program output: WAVE FILE which contains Turbo 2000 record of input file. WAVE file could then be recorded to cassette (or CD), readable by Atari hardware.)

Richard Bannister 1/04
See also: Chris Lam
Dublin
Ireland
http://www.bannister.org/
Developer: Rainbow v1.5.0 - port of Rainbow 1.4 (Atari 800 series emulator

for MacOS 9) to Mac OS X, Emulator Enhancer v1.4.1

Lee Barnes 10/04
http://www.mathyvannisselroy.nl/mydos.htm
http://www.mathyvannisselroy.nl/aspi.htm
Developer: MyDOS RAMdisk patches, Black Box ATASPI V0.42 ("Atari (Advanced) SCSI Programming Interface"), Black Box ATASPI V0.41

Ullrich von Bassewitz 5/04
Germany
http://www.cc65.org/
Developer: cc65 2.10.1 - a complete cross development package for 65(C)02 systems, including a macro assembler, a C compiler, linker, librarian and several other tools.

BBK Enterprises (Bryan P. Schappel and Barry Kolbe) 7/05
See: RTS Software

Michael Beck 5/03
Germany
http://www.rho-sigma.de/
Developer: Atari 8bit filesystem for Linux 0.1

Matthias Belitz ("msc") 10/04
http://www.birmanns.de/atari/
http://www.mathyvannisselroy.nl/aspi.htm
Developer: msc-IDE Controller (IDE interface for PBI/ECI -- sold out), IDE software utilities: INSTALL.COM V1.03, SETUP.COM V1.13, FDISK.COM V1.10, MAP.COM V1.10, HDINST.COM V1.00, LMAP.OBJ V1.03, CDPLAY.COM V1.0, CDREAD.COM V1.4, IMG2DISK.COM V1.00.
Black Box ATASPI V0.40 ("Atari (Advanced) SCSI Programming Interface"), ATASPI CDPLAY V0.20 (audio CD player), ATASPI MON V0.12 (SCSI monitor)

Bensley Consulting (Brett Bensley) 1/04
PO Box 301
Westfield IL 62474-0301
USA
tel: (217) 967-5465
Developer: Happy's Programs - Math, U.S. History, Astronauts, Triangles

Best Electronics (Brad Koda) 9/02
672 Commercial St
San Jose CA 95112-1406
USA
Telephone: 408-278-1070 (M-F 1:30pm to 5:00pm PST)
FAX 408-278-1092
http://www.best-electronics-ca.com/

Archive-name: atari-8-bit/welcome
Posting-Frequency: 7 days
Last-modified: March 25, 2005

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

It you want to connect your 8-bit to a monitor you could do what I have done. I just bought a video convertor. The RCA Video part of your cable would plug into that and then you can use any PC VGA monitor. The audio plug would just into any powered speaker. I use it a lot and it works great, much better than a regular TV connection.

You seem to be the sophisticated type, so I suppose you would find the
enormous black tower in Broderbund's "Stealth" ("Landscape") appealing.

What is the fixation with the Spectrum's rubber keyboard? The rubber keyboard lasted from something like 1982-1985. Every Spectrum made after 1985, up until approx 1993 or so when they stopped making them, had plastic keys. And the Amstrad-made ones have a similar typing action to Mitsumi keyboards.

Heh. I'm currently slapping together a box just to run your program for my
Atari out of stuff I had in the closet and crap my friends have given me.
When I get it completed, I'll give it a whirl. But for the time being, I
think I'll leave my current installation of AtariSIO alone 'till then.

Also, what is the likelihood of an internet modem and maybe printing support
in this version? ;)

Slipping/loose drive belt maybe? If you're not afraid to crack open the
case(s), do so and look at the drive belt. If it's lost it's tension, it
can't spin properly. If it looks like it's tight enough, try pulling the
belt off the drum and motor and wiping it down with some rubbing alchohol.
20 years of dust can really screw things up after a while.

And yes, there are/were drive head cleaners available. I bought several of
them years ago at a small computer store back home. Cleaners for 3.5" are
easy to find, but for 5.25", you might have to go to Fry's or find 'em
online somewhere. When I bought mine, each cleaning kit came with one 3.5",
and one 5.25" cleaning disk.

Wish I could say that. Until Cedega matures a little more, I'm stuck with
Windoze for a select few games. But they are constantly adding games to
Cedega's supported list.

If you wanna try your hands at a 100% *FREE* MMORPG game, go check out
PlaneShift, an open source mmo. http://www.planeshift.it It has some
absolutely gorgeous graphics, too.

> will you get an error message telling you the disk is full?

The virtual drive feature of AtariSIO works slightly different than
eg. the H: feature of the Atari800 emulator:

atariserver creates a disk image (which is stored in memory) on the fly
from the data in the given directory. Then atariserver installs an
image observers and looks for changes to the directory sectors. Whenever
a new file (or directory) is created or a file is changed, it applies
the changes also to the harddisk.

This approach has the advantage that it is fully compatible with all
programs and you can do everything that you can do with a standard
(hard-)disk. Eg. use NOTE and POINT to seek within files - some time
ago I tried this with APE but it didn't work correctly. The
disadvantage of this approach is that you also have all limitations
of standard (hard-)disks. For example, the size of the virtual drive
is limited to the size you specified at creation time.

So, if you really have to transfer huge amounts of data or want
access to the full harddisk, the H: handler (or APE PC mirror
feature) is better. If you do "standard work" like storing your
source code or word processing data, the virtual drive feature
of AtariSIO is better, IMHO.

If you really want to transfer a lot of huge files from your Atari
to the PC with atariserver, you can use the following approach:
Copy the first file from your Atari to the virtual image, then delete
the file (also from your Atari) or just format the virtual drive.
Now copy the next file to the virtual image (be sure to use another
name, otherwise the old file will be overwriten).

The virtual drive feature doesn't honor deletions of files and
formatting a drive, so all the files on your PC will be preserved.
The deleted files just won't show up in the virtual drive when
you list the directory from your Atari.

so long,

Hias

Printer support is already working fine (you can print to a file or
through a pipe, eg "|lpr"), and set up Atari EOL (character 155)
conversion: LF, CR+LF, or plain (no conversion).

To add modem support I need some more documentation about the
Atari 850 protocol. The docs that I found so far weren't detailled
enough, they just described some of the basic principles.

So: if anyone has some real good documentation about the Atari 850,
or the source code of the 850 ROM and the 850 driver, please email
them to me.

BTW: the new version of AtariSIO also supports XF551 transfer modes
(at 38400bps), an integrated gamedos (MyPicoDos 4.04) for virtual
drives, and a nice "remote control" feature. You can even execute
shell commands on your PC and have the output sent to your Atari.

so long,

Hias

> 1. Best selling computer of all time.
> 5. The most popular computer of all time.

Please could you prove this to me and how much better selling it is
than competing systems, and do not just quote Guiness World of Record
which is quite often wrong on computer records.

> 2. VIC-II/SID chips.

These extra chips tried to offset the slow speed of the CPU in the
C=64 and in the process increased the price.

BogoMips Dhrystone Whetstones
in C 1.1 in C MIPS
Vax Mips in BASIC (interpreted)
PC XT 0.02 0.19-0.23 0.0015
ZX-Spectrum 0.0154 ?????? 0.00052
C=64 0.0033 0.0205 ?????

The ZX Spectrum Bogomips figure was achieved using z88dk version
1.6 cross-compiling to produce a TAP file. Then the TAP file was run
in the Fuse emulator in 48K Spectrum mode. The C=64 Bogomips figure
comes from the HOWTO and was run under Vice. The Dhrystones where done
with -DROPT and compiled with C Power 2.8 (source Rick Richardson).
The Whetstones are Quick BASIC for PC/XT and ZX Spectrum BASIC (source
Roy Longbottom), compiling or using a different language would help.

> 3. Thousands upon thousands of programs.

The total number of programs that run on the ZX Spectrum is in
5 figures with new releases still happening, see WoS for evidence.
The question is how many programs has the Commodore 64 got?

> 4. BBSs.

The ZX Spectrum can access and run BBSs, however BBSs were not that
important to most people.

Most people did not buy the Atari 400 because it had 8KB RAM and a
membrane keyboard while cost more than a ZX81.

Unfortunately, I've not had a chance to try out anything else with it. I
bought the cable off ebay. I'm pretty sure I've got one of those RF
adapters lying around somewhere-I'll try it next, just to make sure that I
do have video coming out of the 800XL.

Thanks for replying! :-)

I'd suggest that before you start flaming people, you should at least read your own group. You flamed a rather highly respected member of CSS. The man who brought us the most detailed disassembly of the Spectrum ROM doesn't deserve to be insulted by members of his own group.

This confuses me, and leads me to believe that you may have
not had the VCR set to display the line-in connection.

The yellow connector is video, and will not show up on any tuned "TV channels".
You have to choose video-in somehow on your VCR.

Also, what did the ebay ad say about the condition of the thing?

Ken

You mean you will be able to manage disk images from the Atari? SWEET! The
box I'm setting up right now will be PERFECT for that! It will serve no
purpose other than to run Atariserver and SSHD. That's awesome, man.

You can even execute
> shell commands on your PC and have the output sent to your Atari.

I don't quite follow here. What uses would that serve?

I'm talking about the whole thing as a package.
If the seller said it worked, it probably does. ...or did the last time
he used it, which may have been 20 years ago. :')

Do you have a stereo reciever you could plug the audio cable into?
If you just plug the audio cable into a line-in jack on something, and turn on the
Atari, you should hear a faint buzzing noise for 2-3 seconds.
It maks a "BbBbBbBbBbBbBbBbtt" sounds while it's waiting to see if you have a floppy drive
connected.

If no line-in jack... then you could *probably* just touch the white plug to a headphone
plug carefully,
and listen for the "BbBbBbbbBt" sound. Put the headphones on, touch the outer ring on the
white plug to
the largest metal part of the headphone plug, and the tip of the white plug to the closer
of the two smaller
rings on the headphone plug. It will not be loud and it won't burn out your headphones.

This would at least tell you your Atari is booting up. It probably also has video and you
just don't have the VCR set right.

>
> You mean you will be able to manage disk images from the Atari? SWEET!

Yes, exactly! The "remote control" feature works kind of like a
text-shell to atariserver, basically you just send commands in plain
text and get back some output in plain text, too. For example
"st" means "print status" and you get the current drive assignments
and other settings.

> You can even execute
>> shell commands on your PC and have the output sent to your Atari.
>
> I don't quite follow here. What uses would that serve?

There are tons of uses for that. For example you can create a
new directory on your Linux box, rename files, check and manage
the printer queue etc. You can do (almost) everything with it,
just like when telnetting/sshing to your Linux box.

The only limitation is that you can't run interactive programs,
like a text editor or so. But all non-interactive programs work
fine. For example: "sh find . -iname test*.atr", "sh mount /cdrom" ...

so long,

Hias

Do remember that the article only covers from a US perspective. If a UK/Europe
perspective was conducted, the chart would be VERY different in the 8-bit era.

No, the Acorn BBC was far superior for general home use, and I'd say the
Atari 800 was technically a better game machine....(OK sound wise pokey
sucked slightly compared to SID..)

What could the C64 offer? Slow processor and crap disk system - a mildly
upgraded spectrum was more usable.....

Crap sound and graphics, crap keyboard and crap expansion options... the
Spectrum is the cheap and cheerful alternative if cost is your main priority
and not the actual computing experience.
```

The C64 kicked ZX arse in Europe too, except in the UK which is a market
that buys British first no matter how crap it is.

They didn't offset, they offloaded. The figures above do not in any way show
which system was better in actual use, which ofcourse anyone with eyes and
ears knows was the C64.

Six figures more then likely.

Poor excuses, BBS's were very popular at one time when there was no internet
and the C64 was a popular system to run them. The C64 was also popular in
robotics and amateur radio. None of those niches was fed by the lowly,
boring and unimaginative ZX.

I genuinely don't understand how a machine which sacrificed RAM, CPU power and a decent ROM for more a video chip designed for games and an oddity of a sound chip could be described as more of a real computer than its competition.

I had a C64 and a Spectrum growing up. I preferred the Spectrum because it had better publications, better textbooks, better tools - and the games were more fun. There's NOTHING on the C64 that I remember fondly. In fact, when I was a kid and didn't know better, I thought the C64 must have been an entire generation behind the Spectrum because the sound seemed broken, and all game graphics seemed slapdash and badly designed. The machine ended up under a pile of books, while the other machines in the house were played until they gave up the ghost.

Honestly, I'm just about sick to death of the C64 vs ZX thread.

Clockmeister, if you need instruction on how to remove a newsgroup, such
as comp.sys.atari.8bit, which obviously does not belong in your current
"discussion", I'll be glad to help you on how to do this...

I'm only cross-posting now, to make sure you get this message.

Thanks.

Hope you get mine too, it is the last comment I will make on the C64 vs ZX
topic.

The C64 wins every year, I really shouldn't bother with it.

Enjoy your computers and your Christmas!

4835. Technical comparision

Newsgroup: comp.sys.atari.8bit
Date: 2005-12-19 22:17:02 UTC
From: MrScout <mrscout@sbcglobal.net>
Message-ID: <1135030622.187167.110400@g14g2000cwa.googlegroups.com>
Source record: 8742
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm

First, a little background. I have been a heavy user of C64 back in mid 80s, and dabled with the Atari 8-bits and Apple IIs. I've never went past BASIC and some simple ASM routines as far as programming. It's been a long time since I've used an 8-bit machine, until a couple of months ago at a friend's house, when he fired up an 800XL, and we had a blast playing some old games... Ever since then, I started having an itch for actually doing some assembly coding on an 8-bit. I bought a C64, Atari 800XL and 130XE, and now am having a hard time deciding which way to go :)

Basically, I want to learn the ins and outs of the machine, do some "serious" assembly coding, just have a blast, and do not have the time to invest in both architectures, but also do not want to start on one machine just to find out that the other one is in the end faster/richer graphically/easier to control the screen with.

On to the question!! From a purely technical perspective, is there a discussion/article/etc. on the net somewhere that discusses the Atari vs. Commodore hardware in great detail? Anything from pros/cons of PMs of Atari to C64s sprites, limitations of VIC II vs. DLIs, etc...? All that I have found so far has been quite a childish trolling, and I'm really interested in solid technical discussion...

In particular, I'm interested in doing graphically oriented demos and games. Atari is great with it's 128 colors, but I've read that you can duplicate it on the C64 with special effects. So, I would be interested to know how well/accurately/densly can you control changes to the screen data mid-line, during V blank, etc. Is the DLI programming style, which seems very different from a straightforward C64 way (well, except in the way you have to address the individual pictures), better in the end? And how about interupt programming in general? Which machine has more usable posibilites?

Sorry for the long post, but I really hope that I can get some reasonable, constructive feedback!

Thanks!!

MrScout

I stand corrected, the bed-wetter wasn't Starglider... this time.

You are looking at this matter from a purely UK perspective. And please
don't pretend that all of Europe was the same as the UK.

From a worldwide[1] perspective, the Commodore 64 still ruled the 8-bit era.
The Spectrum was only a minor league player.

[1] worldwide includes such far off places as Australia, Japan, etc. We do
not need to include Antarctica as very few penguins used computers.

He only started _this_ crossposted thread. Other recent crossposted threads
were _not_ started by one of ours.

BTW, the ZX Spectrum still loses every time.

If you want a technical comparison, here you go:

C64:

64k of memory
16 colors
160x200 and 320x200 graphics
8 multicolor sprites
3-voice synthesizer chip
Disk drive has built-in DOS
ROM BASIC
BASIC has no sound or graphics commands

Atari 8-bit:

128 colors(early models), or 256 colors
Between 16k and 64K of memory depending on model
Several graphics modes
4 monocolor sprites
4-voice sound(simple tone generator, not a synthesizer chip like the C64
has)
Disk drive requires a DOS disk
BASIC is either in ROM or on a cartridge, depending on model
BASIC does have sound and graphics commands

I still have many ATARI 800 XL carts, multiple copies of most of the
games, all new and boxed, NTSC versions.

Ca. 100 copies of One on One, could be used for homebrew projects.

Also many copies of Ballblazer left.

Payment is possible with paypal :

LIST :

ATARI 800 XL/XE Carts :

3.00 * Ballblazer
3.00 * Crossbow (Lightgun)
3.00 * Hardball
2.00 * One on One
3.00 Final Legacy
4.00 Star Raiders 2
3.00 * Thunderfox
3.00 Pole Position
3.00 David's Midnight Magic
3.00 Desert Falcon

XL carts

3.00 * Tennis

XL Disk (48K)

3.00 * Mickey in the Great Outdoors

Hardware :

Sears Video Arcade II PaddleJoystick Combo 1.- (ca. 100 - 150)

Telegames Paddles 2.- (not working 100%, new and boxed, but
need to be fixed, usually fire button automatically working)

CX-30 Paddles - 6 Euro

Shipping :

-5Kg :

6 Euros Germany
17 Euros Europe (EU)
30 Euros Europe (rest)
32 Euros USA, North America

37 Euros rest of the world

-10Kg :

8 Euros Germany
22 Euros Europe (EU)
35 Euros Europe (rest)
42 Euros USA, North America
52 Euros rest of the world

-20Kg :

10 Euros Germany
32 Euros Europe (EU)
45 Euros Europe (rest)
62 Euros USA, North America
82 Euros rest of the world

-31.5Kg :

12 Euros Germany only

Discounts are possible for large qts.

Please note : Because of taxial reasons, payment cannot be made before 1/1/2006.

> really interested in solid technical discussion...

i've not seen an article that goes into major detail, but i've programmed a little on the Atari and have a good working knowledge of hte C64 so have considered writing one - i'll try to answer your questions...

The C64's hardware sprites are easier to maintain, Atari players are one byte wide and 256 or 128 high and the vertical position is set by writing into a page/half page of RAM at the appropriate point; that means that moving a 16 pixel high object one pixel vertically requires (to do it cleanly, cheating is of course possible) the clearing and then writing of 16 bytes of data compared to a single register write on the C64. The C64's horizontal system is a little more fiddly with the MSB but that's because it has a higher horizontal resolution and, of course, there are eight hardware sprites with up to three colours each (two shared, one individual) compared to four single colour players and four missiles or five players if the missiles work together and nothing to stop either machine recycling the sprites as the scan passes down the screen.

> In particular, I'm interested in doing graphically oriented demos and
> games. Atari is great with it's 128 colors, but I've read that you can
> duplicate it on the C64 with special effects.

About 120 colours have been "faked" using a couple of tricks but to be honest i tend to not do much more than interlaced sprite colours myself; that gives about 24 colours in total and the interlace isn't enough to burn a gamer's retinas out! =-)

The C64 scores over the Atari in one fairly important respect, it can handle all 16 of it's colours on a scanline with no effort; 160x192 on the Atari is 5 colours a line before the players get involved, the equivalent 160x200 on the C64 is 16 a line before the sprites are involved. Similarly, 320x192 on the Atari can only manage two shades of one colour before the players step in whilst the C64's 320x200 is again 16 colours. Both machines have hardware horizontal and vertical scrolling and, whilst the Atari has nice features to manage scrolling maps and the C64 can only smooth scroll by 8 pixels before either moving the data the "long" way or using tricks like VSP or AGSP to shift things, it does have a better horizontal resolution.

> So, I would be interested to know how well/accurately/densly can
> you control changes to the screen data mid-line, during V blank, etc.

Both machines have to perform data fetches on new lines, so there's
limitations to how much you can play with what's going on during a scanline
but it's possible to dynamically alter the display list on the Atari to do
all manner of things on a line-by-line basis. The C64 can do similar, but
it's usually done with $d011 tricks and cycle counting.

> Is the DLI programming style, which seems very different from a
> straightforward C64 way (well, except in the way you have to address
> the individual pictures), better in the end?

Better? Well, yes and no; from a beginners point of view the DLI is an
easier system to pick up because things like screen splits are handled by
the display list itself, hardware smooth scroll is dead easy to work with
and a quick STA WSYNC gets the machine roughly lined up with the start of
the next scanline, but anything more complex is pretty much a matter of
cycle counting like it would be on the C64 anyway and anything that needs
more than two three colour objects per scanline is wandering off into
software sprite territory (one character set on the Atari has 128
characters, compared to 256 on the C64) so it's swings and roundabouts.

> And how about interupt programming in general? Which machine has more
> usable posibilites?

Both about the same really, either the display list or the raster register
trips the IRQ so the C64 just needs a little maintainance for certain jobs
like mode splits.

From a demo coding point of view, the Atari is more the undiscovered
country; the C64 has been mapped pretty much to the cycle by emulator
programmers (the two main C64 emulators, VICE and CCS, are highly accurate)
so there's less new stuff to prod around with. As far as games go, both
machines have an impressive back catalogue but for ease of knocking a
scroller out and shoving eight sprites over the C64 is the easier machine to
develop for to start with at least.

(Please note; posting at 1.40am so if this waffles or fails to make sense i
apologise in advance! =-)

Do the disks have a very 'scrachy' sound when they are inserted? Do any
error codes display on the Indus while trying to read disks?

I fail to see how a Linux/Windows debate fits the thread topic, and I certainly don't see why it's on comp,sys.atari.8bit. If you want to debate the relative merits of Linux and Windows, you should go to one or more of the Linux or Windows advocacy groups. You'll find plenty of people there more than ready to join in.

And for the record, I use Mandriva Linux, Windows 98SE, an Atari STe, and a 130XE. The one I choose to run depends on what I want to do. I really don't care what other people think I *ought* to use, and I don't care what other people want to use.

The ones who disagree with my choices are just wrong, that's all. Nothing to get worked up about.

TJ

Yeah, I get you there. What threw me for a loop was the way you worded it. I
took that to mean "type in command on linux shell, get output on atari."
That is most excellent.

Hmmm... would ssh fall under non-interactive? I think it would blow my
friends' minds to tell them I can (indirectly) connect to their box with a
25 year old computer. :)

Now, one further question and I promise I'll shut up about it. :) What about
a "save state" feature? As I mentioned before, I am piecing together a box
just to run Atariserver, and I intend for this box to run Atariserver and
SSHD *only*. What're the chances of being able to just fire up the box, have
a cron job start atariserver immediately after boot, and when it loads, it
already has the last set of disk images from my last session loaded?

This box is going to be deaf and dumb. No sound, no video (once I get linux
installed of course), no nothing. I want it to be able to just power it up,
wait 45 seconds or so, and then boot the atari. Being able to send shell
commands from the atari to the linux box will be even better for this
purpose, as I will be able to shut it down without having to use a 3rd
machine to SSH in with.

Sorry for the top-post, but where are you guys getting figures of 128 and 256 colors? The Atari really only has 16 colors. Or in another graphics mode you can get 16 shades of grey. You can sort of make it look like it has 256 colors, but that requires alternating graphics modes on every other line. A line of 16 colors, followed by a line of 16 shades of grey.... can make it look like it has 256 colors, but it really doesn't. Plus, that cuts your vertical resolution in half. It does look nice though.

Although I have no experience with the C64, I think the Atari is better graphics-wise. The display list manipulation that you can do is awesome. I was aghast when I first tried an IBMPC and realized how lame the graphics were compared to Atari 800. 4-color CGA?... blah!

I think the sprites on the C64 might be easier to use than Player Missiles on the Atari however. I didn't like the fact that to move them in one direction you actually have to copy the memory around (if I remember right). To move them in the other direction, you just had to change one value. I forget which way was which, but I think the horizontal direction was the easier of the two.

Jason, thanks a ton, this is exactly a comparison I was looking for. A couple additions questions if you don't mind:

- You mentioned that Atari is incapable of displaying more than two shades of one color on one scan line in hi res, or 5 colors in mid res. Is that because you cannot change the color registers fast enough, or because you cannot sync the change in the color registers precisely? As far as I understand the C64, you can have two colors in each 8x8 region, right?

- As far as speed of the machine is concerned, C64 is at 1MHz, and in low intensity situations there is one "bad" line every eight scan lines. The Atari's CPU on the other hand gets interupted by ANTIC on every scan line, but the CPU goes at 1.7MHz so I would assume that it still means you have more clock cycles available on the Atari to do stuff during the H and V blanks, right?

Ken,

My understanding on the Atari colors is that there are 16 colors, each with 8 intensities, except for one mode on GTIA machines which allows you to show 16 intensities of one color. You can display all of them at 80x192. So, it's not simply a matter of selecting colors for the hi-res modes out of 256 colors, right?

I've always thought that the 800 had a mode similar to Amiga's HAM, but from what I've read so far, it doesn't seem so.

Anyway, I've downloaded quite a number of books on both computers, I'll be doing some good reading in the next couple of weeks while I'm off from work, and I have a New Year's resolution to pick the computer by then :)

Ah yes, you're right. But you can't get them all on the screen at once.

Sorry, ssh is an interactive program. With "interactive" I mean all
programs that require keyboard input after startup. ssh requires
that you enter the password/passphrase, the most you could do would
be to use "ssh host command..." and setup ssh access to a remote machine so
that you don't need to enter a password (eg. with RSA authentications
and have a RSA key without a passphrase). You could then run a program
on a remote host, but I don't think that's exactly what you want.

> Now, one further question and I promise I'll shut up about it. :) What about
> a "save state" feature?

Nice idea! I've been thinking about a similar feature (quick access to
several default configurations) for quite a while now, and I think I
know now of a way how to integrate this feature into atariserver.

Could take some time, though. The design of atariserver has grown during
the last months/years and I'll have to rework some parts of it. Maybe
I find some time after christmas or so.

> As I mentioned before, I am piecing together a box

> already has the last set of disk images from my last session loaded?

Actually I wouldn't use cron, but setup the box so that a user is
automatically logged in and have "atariserver" in his .bash_profile.
I use a similar approach for a PC running freevo (a media center
software for linux).

Create a user "atari" (for example) and add the following line to
/etc/inittab:
a5:2:respawn:/sbin/mingetty --autologin atari tty1

This will automatically log in the user "atari" on the first console if
the box is in runlevel 2. To do maintenance (without auto-login), just
run the box in a different runlevel (for example 3).

Create a .bash_profile in the home directory of the "atari" user an
set it up like this:

```
case "`tty`" in
/dev/tty1)
atariserver
esac
```

This will automatically start atariserver, but only if the user is
logged in on the first VT (so you can also do maintenance via ssh
or other VTs).

> This box is going to be deaf and dumb. No sound, no video (once I get linux
> installed of course), no nothing. I want it to be able to just power it up,
> wait 45 seconds or so, and then boot the atari. Being able to send shell
> commands from the atari to the linux box will be even better for this
> purpose, as I will be able to shut it down without having to use a 3rd
> machine to SSH in with.

Shutting down the linux box with the remote control feature of
atariserver (send "sh shutdown" from your Atari) should work if you
add the username "atari" to /etc/shutdown.allow

Yet another possibility: Install acpid on your linux box (and add
ACPI support to your kernel). If you then press the power button
the system will perform a clean shutdown.

so long,

Hias

> Is that because you cannot change the color registers fast enough, or
> because you cannot sync the change in the color registers precisely?

It's not incapable, i was only referring to "stock" without any CPU
overhead; it's possible to split the colour registers and other details
during a scanline, although it's a bitch to do well and the fetches for the
screen get in the way in the same way that the badlines do on the C64.

Generally speaking, pictures tend to be enhanced using player underlays and
line-by-line colour splits rather than mid-line splits.

> As far as I understand the C64, you can have two colors in each 8x8
> region, right?

Depends on mode, these are just the stock ones;

Hi-res char 1 fixed background colour, 1 colour per 8x8 cell
Hi-res char and ECM 4 fixed background colours, 1 colour per 8x8 cell
Hi-res bitmap 2 colours per 8x8 cell

Multicolour char 1 background and two shared, 1 colour per 4x8 cell
Multicolour bitmap 1 background and 3 colours per 4x8 cell

ECM is Extended Colour Mode, it gives a 64 character set with any colour you
like in each attribute cell and the upper two bits of the character byte
specify which one of four background colours that cell has.

> stuff during the H and V blanks, right?

The time lost to the ANTIC is variable depending on screen dimensions and
mode whilst the VIC-II's overheads are fixed but generally speaking yes, the
overall CPU speed is higher. Both machines are marginally faster when
they're not having to deal with screen data, for example during the upper
and lower borders.

there are a few different modes similar to the Amiga's HAM or HAM-E
one is called RIP. Someone else can prob eleborate more.

Ken Swanson wrote:
> Ah yes, you're right. But you can't get them all on the screen at once.

Yes you can, the colour registers are all seven or eight bits depending on mode. Without CPU load, the hardware can do five colours a *scanline* without trickery or sixteen shades of one colour (any colour, not just grey) in the 80x192 pixel mode but there's nothing to stop the colours being split on a scanline-by scanline basis or finer than that if the programmer's good.

If the base colour on the 16 shade mode is split once a scanline it can display all 256 colours in a 16 scanline high area easily.

Hah, you think?
The zx spectrum's edge connector made it ideal for robotics.
And yes, there were radio comms programs for the spectrum.
zxRitty (I think it was called) being one of them.
Why would the spectrum be unsuitable for ham radio data transmission?
It has audio tape as its default storage medium, seems ideally suited to me.

I would do it a bit differently, since I'm not much good with those
carry bit tricks:

```
txa
clc
adc cursor_x
tay
txa
bmi _negativ ; mx=negativ? yes -> _negativ
cpy MOD_max_x
bcc _lesser_max
ldy MOD_max_x
_lesser_max
sty cursor_X
rts

_negativ
tya
bpl _lesser_max
ldy #0
beq _lesser_max
```

Not exactly. Despite the fact that the CPU in a C64 runs at 1 MHz, the
bus of the C64 runs at 2 MHz which means that most DMA cycles do not
stop the CPU. This is different on Atari where the bitmap DMA usually
takes every second cycle in display area and also DRAM refreshes etc
cost the cpu some cycles.

Regards.

When my work and the world was hit hard by the "I Love You" virus, I disconnected my PC for a day at work and brought in a Atari ST. I was able to dial into the network, and that was no problem. Getting a word processor that was in par with what was being sent at me was a fun part. And the list just went on and on.

I discovered that no matter how much I did like the Atari platforms, and maybe not as much the windows platforms, well, it was not a bad OS to use at work and then leave at work. :D

Don't own a windows PC at work. I like Atari and Macs. But the Windows platforms have their place.

Unheard of unlike the C64 and other systems which were popular among radio
operators. Sure it is possible, but I don't know of anyone who actually used
a ZX for that purpose.

> It has audio tape as its default storage medium, seems ideally suited to

The default storage medium was tape for virtualy all the 8 bitters, that in
itself proves nothing.

It proves that the Spectrum was more than capable of the task.

How many times have you actually used a Spectrum? how much research have you
actually done? Because everything you write points to a man who has no idea what
they are talking about.

Oh, and still waiting for the answers to the questions I set you. Why are you
avoiding all requests to those questions?

The both failed at the exact same time?

I would tend to think its a connection problem. Check both your SIO cables with each drive, one at a time, configured as drive 1 of course.

Do you have an SIO2PC cable of the like or any other SIO attached device which you could use to confirm that the SIO port is still working?

A bad disk could "gum up" the heads of both drives but the drives would not be quiet as you say they are. You would hear excessive head seeking. (I think Steve Tucker was talking about this).

Head cleaning disks used to be cheap, like $2 USD but they are hard to find now. The fiberglass one were more expensive but tended to last a very long time. (Mine's about 20 years old). Don't even know if the internet specialty stores carry 5.25 cleaning disks.

I doubt if the the experts ever reccommended cleaning disks anyway, prefering to clean the heads with solvents and swabs instead.

Well, that's my 2 cents worth.

I did say AUDIO...
Not all machines stored to tape using audio, did they?
If so, why did the commode require an expensive proprietory tape recorder to
save stuff (if you didn't want to take out the second mortgage required to
buy the disk drive)

Display list interrupts are not hard to do but from a practical stand point it is just a pissing contest to say how many colors you have.

Most games were written using Gr. 12 or 13 IIRC, whatever the 5 color ~text type mode with a redefined character set. This gave effectively the same resolution as Gr. 15 with an extra color. The advantages were they only took up ~960 <or 480 for the lower res> bytes to do a complete screen and modification took much less effort. These modes were available to machine language programmers from the early days and BASIC from the XLs.

Just for an example, I did a short 3d type dungeon with animated torches. All that was necessary to make the torches flicker was to change the two byte pointer character set pointer to a second character set with a redefined torch. Point being if I had wanted to animate dozens of things on screen like the torches it would not have taken any more over head, just additional redefined items in the 2nd character set.

But even with simple and slow techniques, like only having one character set with two torch definitions in it, it would have only required two bytes be alternatively poked into screen memory to animate the torch. Very fast compared to any high color or high res bit map mode.

>> ...

The Atari is super cool, with at least one or two features that none of the other 8-bit machines can match.

But. the original Atari 400/800 computer models were released in 1978 (1979?) and thanks to the very advanced architecture seen from a late 1970s perspective, the 8-bit Atari could compete with some competitor models released 2-4 years later.

My conclusion is that the Atari cannot match the specification and the enormous game library for the C64, but there are a few things that the Atari can do that to my knowledge no other 8-bit computer can do.

It could be argued that the Atari 800XL model was a bit obsolete for its release date, but it also gave us all a glimpse of what the future would bring, with some of its exceptional 256 colour images and shining metal effects.

If you have not already done it, I think you should take a look at some top rated game titles and perhaps a couple of demos for the Atari.

Anders

4880. Re: Technical comparision

Newsgroup: comp.sys.atari.8bit

Well, I've been doing a lot of research today, and I think I got a
better understanding of the speed difference between the two machines.
The comparison below is between both machines in the default text mode,
no sprites or anything else that would steal more cycles away, and in
NTSC:

C64: every 8th scan line VIC II halts the 6502 to fetch color and data,
and every line for memory refresh. So, we got:

65 cycles/scan line x 263 lines/frame = 17,095 cycles/frame
LESS
40 cycles/line x 32 bad lines
3 cycles/line x 263 for memory refresh
EQUALS
15,026 cycles/frame available

Atari: every line 9 cycles for memory refresh, plus 1 for each byte of
char fetched, one every 8th scan line for char set data plus display
list itself. So, we got:

114 cycles/line x 262 lines/frame = 29,868 cycles/frame
LESS
9 cycles/line x 262 lines
40 chars x 8 bytes x 24 lines
40 chars x 24 lines
EQUALS
18,870 cycles/frame available

I'm assuming that as the graphics get more complex, the Atari will
start stealing even more cycles than the C64, so the difference will
get smaller.

Anyway, even though the speed advantage is a lot less than the Mhz
difference would suggest, it's still a pretty good margin.

If I made any errors, or if there is more to the picture, please
correct me!!

MrScout

> EQUALS
> 15,026 cycles/frame available

there is 312 lines per screen on the pal systems that are most common.
In any case, your numbers don't add up for either PAL or NTSC systems -
there is 63 available cycles after memory refresh for PAL, and 65 cycles
after memory refresh for NTSC - or 64 on the rev0 NTSC vic. Your
numbers fail it.

Additionally there is onyl 25 bad lines per screen - one per displayed
charline.

63 cycles/line x 263 lines/frame = 19656 cycles/frame
LESS
40 cycles/line x 25 badlines/frame = 1000 cycles/frame
EQUALS
18656 cycles/frame available with the screen enabled.

> 114 cycles/line x 262 lines/frame = 29,868 cycles/frame
> LESS
> 9 cycles/line x 262 lines
> 40 chars x 8 bytes x 24 lines
> 40 chars x 24 lines
> EQUALS
> 18,870 cycles/frame available

Which is remarkably close to this figure, although I am reluctant to
believe your atari figures either, given how badly you butchered the c64
figures.

BTW, for NTSC:

65 cylces/scanline x 263 cycles/frame = 17095 cycles/frame
LESS
40 cycles/badline x 25 badliens = 1000 cycle/frame
EQUALS
16095 cycles/frame avaialble on NTSC, however it should be noted that
there are 60 of these per second - allowing for a total of 965,700
cycles/second available there, vs. 932,800 cylces/frame avaialble on
PAL.

Exactly. You can also force the C64 to fetch color data more than that
so you get 1 pixel high color cells. This is called "FLI" in C64 world
and produces very high color resolution.

> 65 cycles/scan line x 263 lines/frame = 17,095 cycles/frame

65x263 on NTSC, 63x312 on PAL

> 40 cycles/line x 32 bad lines

The BA (bus allocate) of the processor is set 3 cycles before a DMA
operation starts, it will stop the cpu on memory read operations. This
means, depending on what is currently executed a bad line takes
41-43 cpu cycles. Also, there are not 32 badlines but 25, because the
C64 has 40x25 color cells/characters.

> 3 cycles/line x 263 for memory refresh

Nopes, there are 5 cycles per line DRAM refresh, but those are hidden
in the DMA cycles.

Another thing which is propably worth to mention: A C128 is fully C64
compatible, but has a flag to force all DMA cycles to be used by
the CPU which results in a 2 MHz mode. You can use this 2 MHz mode
in border areas which results in ~ 1.3 MHz effectively.

Regards.

Listen, can you guys please take this OFF the comps.sys.atari.8bit
newsgroup? It really has no business here. I for one, love my Atari 8bit
but am not interested in the least in some thread involving a spat between
C64 users and Spectrum users.

Please? Thank you.

Yea really why do these moron's keep up this mindless arguing about
which outdated platform is the best? This was getting old 20 years
ago (seriously think about it) anyway I like my 65xe too (love might
be alittle too strong) and I even have room for a c128 in my retro
collection (heresy I know).

Morons is an understatement.

My system of choice was the Apple //e and //c because that's what I had access to. The C64 may have been a better system for games but I never really had access to one. Well, I've used 'em a few times. I have fond memories of all the systems I've used and would get all of them again if I could.

The Atari has palette 128 or 256 colors to choose from. Showing them all
at once is a different story. The C64 has just 16 colors, that is it,
but showing them all at once is easy.

> Although I have no experience with the C64, I think the Atari is better
> graphics-wise. The display list manipulation that you can do is awesome.

Display list seem like a cool feature, but I don't see what it can do
more than what the C64 can do with raster interupts, with the exception
that display lists do not require CPU load. The VIC chip can be
programmed to generate an interrupt when a certain raster line is
reached. Raster interrupts are useful for all kinds of tricks like
switching graphics modes halfway the screen, soft scrolling only a part
of the screen, changing colors, sprite multiplexing, opening the
borders...etc.

> I was aghast when I first tried an IBMPC and realized how lame
> the graphics were compared to Atari 800. 4-color CGA?... blah!

From a C64 perspective CGA graphics suck big time too.

> I think the sprites on the C64 might be easier to use than Player
> Missiles on the Atari however. I didn't like the fact that to move
> them in one direction you actually have to copy the memory around
> (if I remember right).

Not on the C64. You just provide the X and Y coordiantes and the VIC
chip takes care of the rest. On the Atari you have to move memory around
if you want the player to move vertically.

> To move them in the other direction,
> you just had to change one value. I forget which way was which, but I

Correct.

From the C=64 v Speccy Flame War FAQ
http://www.speccyverse.me.uk/comp/accus/spectrum/

Q1.1 The ZX Spectrum can be used as a door stop?
1.2 Did the ZX Spectrum normally use REM statements to store machine code?
A1. People who say this are thinking of the ZX81 or (TS1000 which is a
ZX81 clone) these are not Spectrums. While the ZX81 may be wedge
shaped it will definitely not fit under a door.

Software base for the ZX Spectrum
9968 WoS archive minus type-ins, demos, compilations, covertapes
+1592 MIA
+1707 demos
+3513 magazine type-ins (from TTFN, includes ZX81 etc)
+Timex (50+)
+books type-ins (500+)
+other magazines (fanzines, non-UK etc) type-ins
+cover tape programs, disczines
+PD libraries (1000+)
+CP/M (10,000+)
+hacked software
+other operating systems software and emulators
+compatible programs (Pascal, Forth, BASIC, Basicode, C etc)
+misc
-duplicates
========
Total >30000 (easily)

There are over 4000 piece of music for downloading, and many graphic screens
as well.

The floppy disk drive speed of the MB-02 is 40-50KBs according to the
manufacturer 8bc.

The DTV uses a Kempston style stick which created the standard for joystick interfaces for the ZX Spectrum, why does it not use a Commodore joystick or are they the same. The best interface for playing games is a keyboard and the range of game styles must be limited by only having a joystick as the input method. JSW was easier to control on keyboard than joystick.

Like Starglider I am still waiting for Whetstone, Dhrystone 2.1 and any other benchmark results for the C=64 (especially interesting that you think it cannot be beaten by the Spectrum). Atari 800 owners have yet to submit a single result!!!!

Table still stands at:
BogoMips Dhrystone Whetstones
in C 1.1 in C MIPS
Vax Mips in BASIC (interpreted)
PC XT 0.02 0.19-0.23 0.0015
ZX-Spectrum 0.0154 ?????? 0.00052
C=64 0.0033 0.0205 ?????
Atari 800 ???????? ????????? ??????????

The fastest computer so far is the Sinclair ZX Spectrum.
The annual contest between the C=64 and Spectrum can be decided by an agreed scoring system of how good each computer was. Once this is done other computers can be scored as well.

Still waiting for these threads to quit being posted to
comp.sys.atari.8bit!

I can only assume at this point, that C64 owners and Spectrum owners, in
these threads, are damn fools and don't know how to stop crossposting.

(I deliberately crossposted to make sure this point is getting across.
Something that I very much don't do normally)

A good test so far, but I do not think that any execept the 8086/88,
can beat the Z80 at astonishing 3.54MHz.

Even that, this test should be also summarized into, IMHO. I suggest
the speccy will also loose (VIC-II, Antic etc.) here and there, but I
am optimistic.

Best Regards,

Daniel Mandic

Yeah, they're not great. But I don't think the PCs of that time were any worse at gaming than the Apple II was. The Ataris and Commodores easily outdid both of them, however.

These threads are nothing more than a geriatric dick waving contest. These machines were outdated 20 years ago, but that has nothing to do with why I keep my Atari around. It's the machine I gew up with. It was my first computer. That's all the reason I need to keep playing around with it. :)

Well, it was certainly an interesting chat. That was the first time I ever
used my 130XE to telnet.

Greg Goodwin clued me into an interesting way to get my Atari to connect
directly to the www without the need for a PC to act as a proxy. Albeit a
little expensive...

Was definately fun.

Hi all,

Apparently my digital camera no longer functions. So I cannot take any pictures of the MIO or the adapter card. It was an old crappy Kodak DC-210 that took blurry pictures anyway.

The XE adapter card has two card edges, the XL side which has two large rubber feet, and the XE side, which connects to the cartridge port of the XE. The top of the adapter has TWO blue cartridge connecters, assuming one for a RTIME and one for a standard Atari 8 bit cart. The PCB is masked over in black with ICD Inc, EXTNDR REV 1 slightly visible from the mask.

Any other questions, feel free to ask.

Thanks,
Rory

Thanks guys. I've tried different SIO cables with similar results. I don't know if you're familiar with the Indus in particular, but it makes a lovely whirring sound and then spins up through 39.

Currently, they sometimes do that, and then they load disks, but usually there more of a quick hiccough and they won't read the disk. (LEDs do the standard go to 20 and then G4 BEEP)

My wife has this week become an Atari fanatic (sings praises) and is going to by an SIO2PC. I also bought a new Indus AND a head cleaner disk from Bravo Sierra for 8 bucks. Apparently I have to go to Radio Shack for fluid--any idea on that?

Thanks again. So nice to see the Atari community is still alive.

Just use regular drugstore alcohol. If the drive is very dirty you will have to use the disk 5-6 times, they dont really clean very well. Just put a few drops of the stuff on the exposed portion of the disk, insert it and turn the drive on. Then turn on the Atari to make it spin for awhile while trying to boot.

Where's the code at? I assume, since we aren't talking asm here, that
we all need to run standardized code, at least within the limits of our
compilers/interpreters?

Seen code for BogoMips on the Sinclair group, downloaded it, have it
stuck somewhere on here, but if you can point to all just so I can make
sure that I'm wasting my time necessarily (instead of wasting my time
unnecessarily). Not that it makes any difference...

I have also used regular isopropyl alcohol on an old Percom Data drive that I
use from time to time. It will not read any disk until I clean it.

Sorry, that's... what's the word... oh yes, *bollocks*. The C64's I/O could be sluggish if software accelleration wasn't used (and it usually was) but for transfer speeds the Atari's SIO bus could lightly toast *both* machines and eat them as a snack.

Unless you mean the actual CPU power, in which case a 1.7MHz 6502 is only marginally slower than a 3.5MHz Z80a when the cycle times of the commands are taken into consideration and the Atari has the ANTIC hardware helping out, assorted character-based screen modes like the C64 (in fact, they're a bit faster because the screen RAM is only 960 bytes long for most modes and 480 for the really quick ones) and hardware sprites.

Someone's feeding the output of a Markov chainer into the thread, aren't they...?

> that display lists do not require CPU load.

They do take *some* CPU load, but the main advantage is that they do
everything *easily*; changing screen modes on the C64 is a matter of loading
the registers, waiting for the end of a scanline and dropping those values
in before the next badline has a chance to notice whilst the display list
simply says "do 20 character lines of this display mode with smooth scroll
enabled, do 8 rasterlines of nothing, do 24 lines of bitmap screen mode with
hardware scroll turned off" or whatever and the hardware splits all the
changes perfectly for you.

> Raster interrupts are useful for all kinds of tricks like
> switching graphics modes halfway the screen, soft scrolling only a part
> of the screen, changing colors, sprite multiplexing, opening the
> borders...etc.

The DLI system could do the colour changes, recycling of sprites and so
forth, the Display List itself does switching graphics modes, shunting in
and out of smooth scroll down the display or expanding the display area
vertically and the ANTIC can knock it's side borders out without any tricks,
it's a stock feature.

Yes yes. I remember that 'my ATARI has 1.79MHz and not 1MHz' thematic very well. I dare to say that the C64 is making more nice Graphics than the ATARI. Although both are clunky at block graphic... one makes slim and the other the typical broad one. etc...

> Unless you mean the actual CPU power, in which case a 1.7MHz 6502 is

Well, letï¿½s get back to raw digital performance.

Thatï¿½s the same if you would like to compare a "AMD Athlon2000 with onboard shared-memory GfX, and letï¿½s say a KT800pro Chipset" to a "iP-III/550 with a PNY QuadraFX4000 AGP3.0 Universal" and say the P3 have a faster I/O. Of course, the slower P3 makes better hardware-accelerated graphics (OpenGL and Co.), more colors and smoother but could never get the Athlon and the rest of the system in raw performance, except graphics (but also not in all instances, 2D etc..).

Hello,

I stuck a 1 Meg simm into my Atari 800. Its not compatible with anything. Its just to see if I can do it. I combined the /SEL lines to select the SIMM (as opposed to 3 /SEL for 3 16k cards). The Atari sees 48k (?FRE(0) returns 37xxx something) . SO MY QUESTION... how can I generate /CAS other than using the 74ls158??? How can i condition the signal comming from the capacitor and coil (MUX signal) I would hate to have to use another 74ls158 just for this signal...HELP you digital GURU's!!!

Thanks
Ralph

PS. if im being to vauge or unclear Please e mail me

Just wondering, what is the point of the 1meg simm? do you plan to
use it as a ramdisk?

4923. Broken 800XL keyboard

Newsgroup: comp.sys.atari.8bit
Date: 2005-12-23 03:03:03 UTC
From: stephensheppard@hotmail.com
Message-ID: <1135306983.362627.104340@g14g2000cwa.googlegroups.com>
Source record: 8680

My 800XL has a problem with the "=" key. The contact is very
sensitive. So sensitive that any typing on the adjacent keys can cause
the "=" to be activated. Sometimes the contact even remains closed and
I get repeating "=".

The key itself is not sticking and appears to have full travel. It's
just that contact is made at the slightest touch or vibration.

Is there any possible fix for this?

- Steve Sheppard

This part of the BogoMips code is rather interesting:

```
/*
* This is a chronic cheat! The code is completely different and runs
* many times quicker..<ahem>
*
* We could just forget it really!
*/

#ifdef Z80_DELAY
static void delay(long loops)
{
#asm
.del_loop
call l_declong
ld a,h
or l
or e
or d
jp nz,del_loop
#endasm
}
#endif
```

With the current BogoMips code 6502 based systems have to do with a C implementation of the delay() function. So it is really a 6502 C-compiler test against hand crafted Z80 assembly code, in other words a rather meaningless comparision. I wonder what the scores would be if a 6502 assembly implementation of the delay() function is used.

I dunno, in looking over the code, if it is compiled as written (there is no #define Z80_DELAY), it will use the "portable version" as that is devined at top of source...

Take a look at it, it looks like even Linux is tuned to use an asm version with the proper define "CLASSIC_BOGOMIPS" (if that is what that crud evaluates to, guessing based on the 'asm' and the 'ax'). So apparently, we all need to add an asm version to replace the portable version for each microprocessor we run it on!

Here is the code (it ain't as long as most messages on alt.lang.asm ;):

```
/*
* Standalone BogoMips program
*
* Based on code Linux kernel code in init/main.c and
* include/linux/delay.h
*
* For more information on interpreting the results, see the BogoMIPS
* Mini-HOWTO document.
*
```

```
* version: 1.3
* author: Jeff Tranter (Jeff_Tranter@Mitel.COM)
*
* djm 20/3/2000
* Made a little bit more relevent for 8 bit machines in the printing
* stage...should be right!
*/

#include <stdio.h>
#include <time.h>

#define PORTABLE_BOGOMIPS

#ifdef CLASSIC_BOGOMIPS
/* the original code from the Linux kernel */
static __inline__ void delay(int loops)
{
__asm__(".align 2,0x90\n1:\tdecl %0\n\tjns 1b": :"a" (loops):"ax");
}
#endif

#ifdef QNX_BOGOMIPS
/* version for QNX C compiler */
void delay(int loops);
#pragma aux delay = \
"l1:" \
"dec eax" \
"jns l1" \
parm nomemory [eax] modify exact nomemory [eax];
#endif

#ifdef PORTABLE_BOGOMIPS
/* portable version */
static void delay(long loops)
{
long i;
for (i = loops; i != 0 ; i--)
;
}
#endif

/*
* This is a chronic cheat! The code is completely different and runs
* many times quicker..<ahem>
*
* We could just forget it really!
*/

#ifdef Z80_DELAY
static void delay(long loops)
{
#asm
```

```
.del_loop
call l_declong
ld a,h
or l
or e
or d
jp nz,del_loop
#endasm
}
#endif

int
main(void)
{
unsigned long loops_per_sec = 1;
unsigned long ticks;
unsigned long bogo;
unsigned long sub;

printf("Calibrating delay loop.. ");
fflush(stdout);

while ((loops_per_sec <<= 1)) {
ticks = clock();
delay(loops_per_sec);
ticks = clock() - ticks;
if (ticks >= CLOCKS_PER_SEC) {
loops_per_sec = (loops_per_sec / ticks) * CLOCKS_PER_SEC;
bogo = loops_per_sec/500000L;
sub = loops_per_sec/5000L;
sub %=100;
printf("ok - %lu.%s%lu BogoMips\n",
bogo,
(sub<10)?"0":"",
sub
);
printf("loops_per_sec=%lu\n",loops_per_sec);
return 0;
}
}
printf("failed\n");
return -1;
}
```

No, it has 128 (16 colors, 8 luminances each) and 256 in GTIA mode 9 (16 colors and 16 luminances each). Displayable at one time.

> Or in another graphics mode you can get 16 shades of grey.

To be strict: 16 shades of any of the 16 colors.

> You can sort of make it look like it has 256 colors, but that

No, it really does. Alternating these modes you get sorta 8-bit per pixel and full 256 colors in 80x96 (or 96x119 if preferred). However, this trick only works on PAL TV.

KMK

>
> - Steve Sheppard

Nevermind I figured out a way to fix it.

Under the keycap there is a plunger. Under this are two concentric
springs. The inner spring is what pushes on the membrane switch. I
guessed that this spring was applying too much pressure even when the
plunger was fully extended (upward).

To fix it I just wound the spring tighter making it fractionally
shorter. I think it still applies pressure to the switch when the key
is up but not so much as to actually close the switch.The key seems to
have the same pressure and sensitivity as all the others.

I hope this is an adequate fix.

Regards,

Steve Sheppard

Agreed; BogoMips is based on the assumption that each iteration of the
delay loop takes two instructions. This isn't true for the Z80 assembly
version, and is most certainly not true for the C compiled 6502 version.

With CC65 (a C compiler for 6502 based systems), the C64 gets a score of
0.0036 BogoMips. In other words according to this test a C64 executes
only 3600 instructions per second. The 6502 may be slow, but not that
slow. The code CC65 generates for the delay() function is quite
horrible. The 6502 not ideal for compiled languages, and strugles with
long data types.

My 6502 coding skills are a bit rusty (at has been at least 15 years
now). But when I replace the C version with a 6502 assembly version (the
code below can be compiled with CC65), the C64 version achieves a score
of 0.36 BogoMips (100 times better than the C version). I expect the Z80
version can be improved too; a Z80@3.5MHz should be quite a bit faster
than a 6502@1MHz. However BogoMips remains a rather pointless test.

```
static void delay(long loops)
{
asm("ldy #3");
asm("lda (sp),y");
asm("sta ptr1+1");
asm("dey");
asm("lda (sp),y");
asm("sta ptr1");
asm("dey");
```

```
asm("lda (sp),y");
asm("tax");
asm("dey");
asm("lda (sp),y");
asm("tay");

asm("beq %g", L2);
L1a:
asm("dey");
asm("bne %g", L1a);

L2:
asm("cpx #$00");
asm("beq %g", L3);
L2a:
asm("dex");
asm("jmp %g", L1a);

L3:
asm("lda ptr1");
asm("beq %g", L4);
L3a:
asm("dec ptr1");
asm("jmp %g", L2a);

L4:
asm("lda ptr1+1");
asm("beq %g", end);
asm("dec ptr1+1");
asm("jmp %g", L3a);

end:
}
```

<snip>
> However BogoMips remains a rather pointless test.

After a little testing this morning, I'm inclined to waste no more time
on it.

Compiled for my 450 mhz PII on Fedora Core 2, it gave 118. The one with
this release gave 884...

so the name isn't all that misleading, but it would be a waste of time
(to try porting to a machine with a weak small-C compiler, on my part,
or to use a C compiler that produces non-optimal code, thus becoming a
test of compilers like Magervalp stated some messages back).

It is bad enough that I don't do any PRODUCTIVE programming anymore,
but finally I am growing tired of non-productive stuff like this!

I think if you reread Ralphy's post, you'll find that he very clearly wrote
the following:

"I stuck a 1 Meg simm into my Atari 800. Its not compatible with
anything. Its just to see if I can do it."

Amazingly, Ralphy wrote that in very clear English. If you'll indulge me,
Kevin, I'll attempt to translate the above for you.

Ralphy says, "I stuck a 1 Meg simm into my Atari 800."

From this sentence, we can safely conclude that there is a one megabyte simm
in Ralphy's Atari 800 computer. We know that there is, or was, a one
megabyte simm in Ralphy's Atari 800 computer, because he very clearly stated
that he had put one in there. We do not know whether this one megabyte simm
is still in Ralphy's Atari 800 computer.

Next, Ralphy says, "Its not compatible with anything."

From this sentence, we can conclude that the simm doesn't actually work with any application or operating system that is currently available for the Atari 800 computer. We are basing this assumption on the fact that Ralphy has clearly stated likewise.

Ralphy then says, "Its just to see if I can do it."

Ah, the moment of truth. Why did the man climb the mountain? Because it was there! Why did the chicken cross the road? To get to the other side!

What's the point of putting a one megabyte simm in an Atari 800 computer? Just to see if it can be done.

We lay persons call it a challenge... or an experiment... or, dare I say it, an adventure... And adventure into the unknown! As Captain James T. Kirk began every episode of the original Star Trek series, "...to boldly go where no man has gone before..."

I hope that explains it for ya, keven. Please excuse my rather extensive use of the elipsis...

Don't forget Space Pussies! Who could forget that wonderful game where you played the role of sperm-spittin' dick, blasting away at all the little pussies as they descended from the heavens and fell to Earth. Take that you pussy!

By the way, Space Pussies was a real game that was available for the Atari 8-bit computer. It was modelled after space invaders, I believe.

very funny... I realise the mod wouldnt be compatible with other 800
above 48k upgrades or any XL/XL upgrades, but that doesnt mean the
extra memory couldnt be used in some fashion as a ramdisk at some
point.

Technical specifications aside, the Commodore 64 was one of the ugliest
8-bit computers ever produced. Personally, I was partial to the aesthetic
style of the Atari XL series computers. The Commodore Vic-20 and 64
computers were really ugly in that retro DEC meets the eighties kind of way.
The later 64C and 128 models were a huge improvement as far as physical form
factor went. The 1541 disk drive looked to seventies disco era. The Atari
400 and 800 computers wer not much better, but the XL line did have a rather
appealing nouveau industrial look. The later XE line blended sleek design
with that wonderful "cheap tramiel crap" look of the mid-eighties.

The TI 99/4a was something that only a true geek could love. And the Timex Sinclair? Well, let's just flip that page in the personal computer jistory books. Oh, let's not forget the Tandy offerings? Those insanely priced paperweights had all the appeal of a techno-nympho... You knew you were getting screwed if you were contemplating one of those dinosaurs.

Anyway... To each their own...

that is true, and yet there are some great games for Apple II series.
Every system when faced innotive program design or programmers capable
of pushing the system to it's limits (and many times exploiting it's
flaws making them assets) has great software. That is why there is no
clear winner when comparing two so similar platforms (c64 vs XL/XE)
there are examples of (supposidly) impossible things on both
platforms.

Your ding dong wasn't getting stuck in the PBI slot, it was telling you that you were missing the hole. It's bad enough that you're molesting machines, but you're molesting male ports? Damn! Stick with the female ports and slots!

Oh, and "ding dong" is so passe! Sounds too much like a doorbell. If you ask me, you want a sound effect that really drives home the whole hammer pounding experience... Might I suggest the "thump"? Yeah, the thump suggests that you probably finish with only one swing of the hammer, but you can't have everything... Right?

That is true! However, you're putting the buggy before the horse. The whole point of the exercise, from what I gather, is just to see if the 800 will even be able to recognize the one megabyte simm. It's sort of a solution in search of a problem... Although, the problem of having the 800 even recognize the simm is the most immediate challenge...

When you're doing something for no particular reason, there still exists an order of operations.

Order of operations? Get it? From math class? BEDMAS! Brackets, Exponents, Division/Multiplication, and finally, Addition & Subtraction.

Anyway, since Ralphy isn't doing this project to address any real problem, there's really little incentive to immediately seek an apparently nonexistent problem.

Now that I think about it, one megabyte of memory in an 8-bit computer would not really have much practical use. I'm sure ralphy recognizes this. That's probably why he's doing it just for the hell of it.

4943. You guys ever find any cheap 1200XLs?

No, you really don't understand the concept of intrinsic value.

The MIO can be 100% replicated at very little cost with modern technology.
Let's say that the MIO can be 100% replicated for a total cost of nine
dollars. That would mean that the MIO has an intrinsic value of nine
dollars. Why? Because the MIO cannot exist for less than nine dollars!

Think about it! It's not terribly difficult!

If an MIO can be manufactured for nine dollars and someone is willing to pay
fifty dollars for it, does that mean that the MIO has an intrinsic value of
fifty dollars? Absolutely not! The intrinsic value remains nine dollars!
Nine dollars is it's real value!

Fifty dollars is an arbitrary value with absolutely nothing to support its
imaginary existence. Why is the MIO worth fifty dollars? It's not!
It's worth nine dollars! Why? Because that's how much it costs to produce
one! You cannot produce one for less than nine dollars!

Let's say that a vendor produces MIOs for nine dollars and sells them for
three dollars... In this particular case, what is the intrinsic value of
the MIO? Well, the intrinsic value is still nine dollars! Yes, even if
you're buying them for three dollars! The logic works the same in both
directions!

Oh, and don't even bother trying to mix sentimentality with intrinsic value.
Intrinsic means real! Sentimentaility is irrational and stupid! Anybody
that confuses intrinsic value with sentimental value, is one of those people
that P. T. Barnum accused of being born every minute.

Do you know what the word "context" means, Mr. Cortez? I've taken nothing out of context! You're just not quite getting it! Uh, huh...

No you really look up intrinsic in the dictionary. You have no idea what
it actually means. Not to subtle of a hint: It doesn't necessarily have
anything to do with money or monetary value like you are trying to
characterize it. Belief in Jesus is intrinsic to a Catholic for example.

Okay, here's the definition of "intrinsic" as taken from dictionary.com:

inï¿½trinï¿½sic (P) Pronunciation Key (n-trnzk, -sk)
adj.

1. Of or relating to the essential nature of a thing; inherent.
2. Anatomy. Situated within or belonging solely to the organ or body part
on which it acts. Used of certain nerves and muscles.

Let's remember that it was *you* that introduced the word intrinsic to this
discussion.

Let's start by determining which of these two definitions is applicable to
the use of "intrinsic", for purposes of this discussion. Clearly, we're

not talking about anatomy or anything organic, so we must be talking about the essential nature of something. In this particular case, we are talking about the essential value, or the "real" value of something. We are talking about the "Inherent" value of a good or service.

For purposes of this particular discussion, the product we are talking about is the old ICD Multi-Input/Output device. What is the inherent value of the MIO? What does "inherent" mean? It means real! The real value, in terms of an arbitrary valuation system like dollars and cents, is the minimum cost that the product can be produced for. In essence, the inherent value is the tangible cost to create something.

An MIO has real value because it must be created. It is manmade! It costs money to make something! The total cost involved in making an MIO is its inherent value. Its inherent value is its intrinsic value.

If something sells for less than its manufacturing cost, then it is not feasible to continue producing that good. Why? Because the real cost or value of the good cannot be recovered!

If the item can be sold for an amount greater than its intrinsic value, the intrinsic value does not rise. The intrinsic value remains constant.

So, what would cause the intrinsic value to change? Increased production costs would cause the intrinsic value to rise. Likewise, decreased production costs would cause the intrinsic value to change. It's a really simple concept that you are obviously never going to understand.

As for equating intrinsic value with cost... Sorry, Bud, but you were the one that initially suggested that the MIO has a higher intrinsic value to collectors... It was you that suggested that the MIO's intrinsic value is measured in dollars!

Read your own posts, dude. You're way out of your element on this one.

Basically would make a good ram disk. Back in the day I had a 130xe
with a ramdisk and later a 800xl expanded to 256k with a ramdisk wich
I used for a bbs. There were people with 1meg ramdisks back then and
altho nowadays I dont see much point in it, if I could upgrade my 65xe
to 1meg with a simm I would do it just because I could (plus I have
about 2 ziplock bags filled about 100 simms of all different shapes
and size)

If you really really think about it. There is no point in doing
anything on an 8bit! I mean it's fun and I am not knocking the hobby
but the 8bits have been pretty well emulated on the PC and other
platforms, and even if you have a 8bit computer you can emulate almost
any device with an SIO. So really the whole retro hobby is sort of
pointless and YET we still do it. So why not a 1meg Atari 800?

That is largely a matter of taste. A lot of people found the supermodel
Twiggy attractive. Personally, I saw her as sort of ugly.

Although I think the later C64c was better looking, I think the
breadbox C64 also looked OK.

I think I'm beginning to understand what BogoMIP's are. Someone shortened
Bogus MIP's to BoguMIP's, but made a typo and it became BogoMIP's.

Yes, it is a useless measure.

Apple][word processors usually had some way of processing lowercase. I
think in the case of Applewriter uppercase was displayed as Inverse, and
ESC was used as capslock. When there's a will there's a way...

That's what the Bogo stands for ;-)

Although it's an interesting exercise I think the people who pointed
out bogomips would be a good benchmark where taking the piss, the
spectrum will make the c64 look like a pocket calculator using cpu
benchmarks.

That said the spectrum still rules and you knows it :-P

Merry Chirstmas, all (-;

I was just wondering why Atari decided to have a disk loading sound. Or is it because the POKEY handels disk access as well as sound output?

Secondly - I can only speak of PAL systems, though - even when those sounds are muted by setting $41 (dec. 65) to 0 they are still audible, at least with all the TV sets and monitors I've used my Ataris with.

On with the holidays, ho-ho-ho,

Frank

No you frigging idiot. One more time: I said the *NEW* stuff had no
intrinsic value to a collector. New stuff being the IDE interfaces for
instance.

Get it yet? Collector of old stuff, paid fortune for MIO. I say the new
stuff has no intrinsic value to him because he is a collector of old
stuff? New stuff is not "Of or relating to the essential nature of a
thing; inherent" of a collector of old hardware?

I am convinced you are just trolling. No one can really be that dense. I
posted before about how idiot trolls in this newsgroup tend to limit my
participation because of their hysterical rants and accusations. Thank
you for popping up to demonstrate.

What level of education do you have, Rick? I'm guessing that you're probably in your fourties, that you grew up in the mountains, you graduated school in grade four, and moved on to oversee the family beetle breeding business. I'm guessing that you live from paycheque to paycheque because you don't understand simple concepts like value. You get ripped off at almost every turn and you believe every word that you read in comic books.

Yes, you, Mr. Cortese, you are a total fucking idiot!

Oh, by the way, your participation is limited because you're a total fucking moron that seems utterly incapable of separating cranium from rectum, let alone fact from fiction, or intelligence from ignorance. You're a nothing, Mr. Cortese! You're a nobody! You will always be a nothing. You will always be a nobody! You are a pathetic loser that does not have any understanding of the world around you.

Being labelled a "friggin' idiot" by you, Mr. Cortese, is tantamount to being knighted by the Queen for intelligence... Being labelled a "friggin' idiot" by you, Mr. Cortese, is tantamount to winning the Nobel Prize! Do you know why? Because people like you are worthless insignificant peons.

Your tiny little cranium isn't capable of understanding complicated concepts like tying a shoe, for example.

Ha! Being labelled an idiot by you? Oh, I guess I'm supposed to feel bad now because a fucking moron can't understand a simple concept... A concept, I might add, that is taught in almost every high school, business school, and street corner on the planet. You're calling me an idiot?

Fuck off and die you disgusting piece of shit!

> --

So we don't totally disagree; I think the 64c was a much better looking machine than the 64. ;) As for the supermodel Twiggy, I have no idea who he/she is... I'm guessing that my ignorance of this "supermodel" is largely due to the fact that she *is*, as you say, sort of ugly. Of course, this is just conjecture on my part.

I also agree that perceptions of what is attarctive or unattractive is, entirely subjective.

So what does it all boil down to? Choices! It's really all about choices... and that, in essence, is what makes the C64, Atari8, TRS80, etcetera, etcetera, so attractive as a whole. We are not forced to use computers that we think are ugly; I chose an Atari8 because I thought the C64 was ugly.

How fitting that I should be talking about choices at such a time in Canadian history. We are currently in the middle of a federal election campaign here in Canada. Elections, as you know, are all about choices. We, as a people, insist on having choices. Sometimes we can be satisfied with just one alternative, and sometimes we need several alternatives.

I choose... Those are probably my two favourite words. I choose! As a kid I used those words quite frequently. My parents attempted to put me in boy scouts, and I chose otherwise. Growing up, many people insisted that I needed a girlfriend, but I chose otherwise.

I choose... Yes, the Commodore 64 was vastly more popular in this neck of the woods, but I chose otherwise. I chose the Atari 800XL. No one is ever going to convince that I made the wrong choice. No one is ever going to convince me that I should regret my choice.

It's election time in Canada, and I'm, once again, ready to choose!

I don't have any 1200XL's kicking around, but I hear that they may have an intrinsic value of $2000 to a collector. I hear that the newer computers have absolutely *no* intrinsic value... but hey, what do I know... I'm a friggin' idiot!

Ooops, looks like I just slit my own throat on that one! I admitted that I don't own any 1200XL computers. Gee, I guess that makes me a friggin' idiot and a troll! I guess I'm not a real Atarian because I only own 4 800XL's!

Hmmm, I wonder what the intrinsic value of my 800XL's would be to to a collector? $17,000 dollars each... Going once, going twice... Sold to the idiot with zero understanding of value!

I don't know too much about the Apple II. I've owned a few Apple II Pluses, but I've never really played with them or done any serious tinkering. I totally agree with you on the idea that seemingly impossible things are possible, when the will to achieve is present and strong.

But then again, sometimes appearances are deceiving and the seemingly impossible are all too probable. Again, the Apple II is a good example. What may have seemed impossible (lowercase characters) became very probable. And eventually, lowercase was shipped as standard. :)

Merry Christmas to you as well.

> Merry Chirstmas, all (-;
>
>
> I was just wondering why Atari decided to have a disk loading sound. Or is
> it because the POKEY handels disk access as well as sound output?

It is to a major degree due to the latter. The sound output is to a good
degree caused because the pokey sound registers are used to setup the
timing base for serial I/O, but read below.

> Secondly - I can only speak of PAL systems, though - even when those sounds
> are muted by setting $41 (dec. 65) to 0 they are still audible, at least
> with all the TV sets and monitors I've used my Ataris with.

This is because the serial line is also wired to the sound output. You
can cut this line, and then won't be able to hear the sound when it's muted.

So long,
Thomas

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I am not sure why, but I am glad it is there. I suppose it was to let the user know the disk is loading. I use an atari disk drive emulator with my Atari 32-bit clone (Hades060) and when the disk image loads, I get the same sound. Kind of neat I think.

Nice picture. <g>

>Today it is 22 years and two days, since I bought my first Atari
>computer, the 600XL model.

I bought my Atari 400 back in 1982. Those were the best days for owning a computer. I miss them greatly.

My first computer was and is a 1200XL which still works, actually. We bought it in 1983 for $300 since no one wanted them. It has an excellent keyboard though the contacts need to be refreshed.

I got another working 1200XL at the swap meet about 10 years ago for $10. Still works. I'll part with it, tearfully, for $2000... ^_~

Dear Mr. Wichhurst,

My advice is that you should turn to the Acorn Group in Cambridge,
England, with a requirement specification and reference documentation
for the specific nuclear power plant you are planning on building. I am
quite sure they can offer a customized hardware solution for your
particular purposes.

Or, since you seem to have deep knowledge of computing and
electronics, you could go to your local computer dealer and buy a
brand new Acorn Atom computer off shelf and write the power
plant control software yourself. Preferrably in machine code then,
to be able to make all your software logic and data fit in the 2048
bytes of on-board RAM memory.

Best regards,
Anders Skelander

Merry Christmas to you too. Happy new year! Skor!

I can't remember when, not to the day anyway, when I bought first Atari. It was an 800 puchased in 1979, October/November, I think. It still works.

Funny, I never did get to see a real 600XL. I think I've seen all the other US models but not the 600XL.

Definetly an Atari. Make sure you have a backup powersupply just in
case. My friend left his Atari 800 on once (with a Krazy SHootout
cart in it) for 2 years (by mistake) and it still worked fine (and
prob still works to this day altho he died... yes his atari actually
outlived him!) but the power supply got really hot and shortly after
the 2 year marathon he needed to replace it.

Why? If Mr. Wichhurst is as good a programmer as I think he is, the nuclear powerplant shouldn't need a back up, but keep supplying him with enough power for the rest of his (Atari's) live.

I think that this may have been attempted before in the early eighties but computers have advanced quite considerably since then so most companies are opting for upgrades. I personally recommend a 130XE at bare minimum. Out of curiosity, which reactor do you plan to use an Atari with?

This message has been cross-posted to a number of revalent usenet
groups, so please do not start a "My system is better than your system
flame war".
============================================================

Relying on my memory and a cursory check on a number of websites it
appears that the majority of Z80 cpu based computers had black and
white displays, where as the majority of 65xx computers had a color
display.

Now there are exceptions to this, but it makes me wonder, did the CPU
influence the display?

Is there an inherent reason why most Z80 computers had b/w displays and
65xx computers had color?

You may think it would have been cost, b&w would be cheaper than color,
but in the majority Z80 computers where more expensive than 65xx
computers.

Now it could have been display size, many Z80 computers used 80 columns
which is hard to achieve when using a TV as a monitor. But on the other
hand, with color you need more memory to achieve a good working
resolution.

So the question is, did the cpu influence the display?

I don't think that is true, at least not for home computers.

There are plenty of (early) 6502 based system which supported only B/W
display, and there are also plenty of Z80 systems which supported color
(ZX Spectrum, MSX, Amstrad CPC, Sharp MZ series, Enterprise...etc).

If we include CP/M computers (which are Z80 based) then what you are
saying might be true. However those where intended for business use. In
those days color was not deemed to be important for business computers.

> Now there are exceptions to this, but it makes me wonder, did the CPU
> influence the display?

There is no technical reason for having a correlation between color
support and the CPU.

> Is there an inherent reason why most Z80 computers had b/w displays and
> 65xx computers had color?

I don't think that statement is true, so the answer is no.

> You may think it would have been cost, b&w would be cheaper than color,
> but in the majority Z80 computers where more expensive than 65xx
> computers.

I doubt that is true either. For example the Sinclair ZX Spectrum was
significantly cheaper than most 6502 based systems, and did support color.

> Now it could have been display size, many Z80 computers used 80 columns
> which is hard to achieve when using a TV as a monitor. But on the other

See my remark at the beginning.

> So the question is, did the cpu influence the display?

No, at least not whether the system supported color or not. Of cource
the CPU is one, but not the only, factor that affects how fast a display
can be updated, but that is another story.

> display.

I must admit I can't think of a 6502 based machine that only had mono graphics, but since all 65xx computers I'm aware of were designed for home use (and hence games) a colour display would have been essential. Most of the Z80 based machines were CP/M boxes designed for business use and back then a colour display wasn't considered necessary for serious applications. Except for the very early machines, all the Z80 based home computers I can think of had a colour display: Sinclair Spectrum (Timex), Amstrad CPC, Tandy CoCo (Dragon), MSX etc.

> Now there are exceptions to this, but it makes me wonder, did the CPU
> influence the display?

Usually the display was handled by a video processor. Texas Instruments made one that featured in most Z80 home computers in one form or another. The ZX80 and ZX81 (TS1000) had no video processor and used the CPU to generate the display. The Spectrum used a ULA (which wasn't as powerful as the TI chip, but was probably a lot cheaper at the time).

> Is there an inherent reason why most Z80 computers had b/w displays and
> 65xx computers had color?

No. As a case in point I believe you can control all the screen modes in the Commodore 128 using the Z80 rather than the 65xx. At the end of the day a CPU is a CPU. You can connect anything you want to it (as evidenced by the proliferation of IDE boards for both the Z80 and 65xx machines).

> You may think it would have been cost, b&w would be cheaper than color,
> but in the majority Z80 computers where more expensive than 65xx
> computers.

That's the business vs's home thing again. Colour wasn't considered necessary.

> Now it could have been display size, many Z80 computers used 80 columns
> which is hard to achieve when using a TV as a monitor. But on the other
> hand, with color you need more memory to achieve a good working
> resolution.

Many mono displays were text only (which is very memory efficient). In fact even on colour computers like the Commodore 64 there was usually a mono text mode available. Also a number of Z80 machines with a 512x192 display achieved 80 column text using a 6x8 font, which is just about readable on a standard TV at that resolution.

> So the question is, did the cpu influence the display?

The answer is still no. In theory you could hook up a Z80 to a modern display card and an IDE storage device and stream graphics to it (I don't advise anyone to try it though).

P.S.

While we're on the subject of graphics I've seen it claimed that the Commodore 64 can do an 8x1 attribute mode screen that is at least as big as (possibly bigger than) the 256x192 (8x1 attribute) screen on the Timex TS2068. But I can't find any reference to it in any of the online C64 documentation. Is this a user mode (Using the CPU to change the attribute byte in 320x200 mode for instance) or is it a hardware mode? Also, if anyone from the other groups knows, can any other machines manage something akin to this mode. I'm working on a project which will use a 256x192 (8x1 attribute) screen mode, and if it is possible I'd like to see it appearing on more than one 8-bit platform. (If you want to kill the cross posts, just post it to comp.sys.sinclair).

Cheers!

I probably should have specified a time period. I was thinking more of
the 78 - 82 time period and computers that were available for home use
mainly in the US (only because that is where I am and have the most
experience with). During that time period the popular computers on the
Z80 side where the Tandy's (and clones), the zx81, ts1000 and some CP/M
machines. On the 65xx side where the Apple][s, Atari's and Commodores.

One reason I was thinking that the cpu could influence the display is
that z80 had a larger instruction set that allowed you to do more with
the cpu than the 65xx. So on the 65xx side you needed more support
chips to do things that the cpu could not.

For example on a 65xx would it be possible to drive the display as is
done on the zx80 (not the ts1000 or zx81 which used a custom chip) and
the cpu with only a few off the shelf logic chips?

z80 machines have b/w displays because the z80 lacks the power to drive a colour display. It just cant move enough colour bytes around. Every z80 instruction takes a few years to complete. The 6502 is a much better processor, as evidenced by the superiority of all the 6502 based machines over their crummy z80 counterparts. Besides, the number 6502 is larger than the number 80, so it has to be better.

Compare a c64 to a spectrum, and youll see what I mean. See the nasty colour clash on the spectrum? That's caused by the z80 being a lousy processor and getting the colours wrong. They actually designed the z80 to run coffee percolators, and then some crazy englishman thought it would be good inside a computer. How wrong was he.

Perhaps you could turn a Spectrum into a coffee percolator.... I dunno.

ps. My c64 kills your spectrum. So there.

As many others have replied, there were plenty of Z80 computers with
color.

If anything, it had to do with the cost of the CPUs back in the day. In
the '70s, many CPUs were relatively expensive (as much as $200), and you
could only buy them in larger quantities like 1000 or more.

The 6502's success was in large part due to when it appeared at a
computer show in the late '70s and was literally being sold right out of
the shipping boxes for $25 each. So it ended up becoming the choice for
early "home" computers where price was important. And the Z80 got used
for "business" computers, particularly because it had CP/M available for
it.

Later on when there wasn't a price premium for CPUs other than the 6502,
the Z80 got used in all sorts of new budget computers.

In that time period there was also the Commodore PET which didn't
support color. I'm pretty sure there were more B/W 6502 based system in
that era on the market, though I don't know about the US situation.

> One reason I was thinking that the cpu could influence the display is
> that z80 had a larger instruction set that allowed you to do more with
> the cpu than the 65xx.

The Z80 had a richer instruction set than a 6502. But that doesn't mean that the Z80 could do things a 6502 could not. However on 6502 it may very well take more instructions to do a certain task than it would take on the Z80. On the other hand the 6502 required on average less clock cycli per instruction. However Z80 based systems usually run at a significantly higher clock rate. This makes speed comparisions between Z80 and 6502 based systems tricky; a 3.5 MHz Z80 isn't 3.5x as fast a 1 MHz 6502, it is generally believed that it is closer to 2x.

> So on the 65xx side you needed more support
> chips to do things that the cpu could not.

The Atari 2600 console (which uses a 6507), the CPU had very little support from the support chips; every display line it had to continuosly feed the "display chip" with new data, since the display chip wasn't able to get the display from memory by itself (like the display chips in most systems). So if speed isn't a concern a 6502 based system doesn't necessarilly require more support chips than a Z80. If speed is a concern, having support chips to offload the CPU always helps, even on a Z80 based systems.

The Z80 did have feature that 6502 did not; the Z80 did have support for DRAM refresh so it could be used with DRAM memory with minimal support circuitry. On the C64 the video chip (VIC-II) is responsible for the DRAM refresh

> For example on a 65xx would it be possible to drive the display as is
> done on the zx80 (not the ts1000 or zx81 which used a custom chip) and
> the cpu with only a few off the shelf logic chips?

The ZX80 to advantage of the DRAM refresh and some other Z80 specific "features" to implement a very simple (but clever) display system. Some aspects like executing a display file might be possible on a 6502 based system, other aspects would require another solution.

On the other hand the 6502 had a feature that allowed display chips to use the same memory as the CPU without slowing the CPU down (at least most of the time). The 6502 accessed memory only one phase of the clock, the other phase could be used by the display chip without the CPU noticing it. Of course the display chip had to be specificly designed to be matched with the 6502, which may explain why 6502 based system often use custom designed chips, whereas many Z80 based systems used of-the-shelf solutions.

I know the Z80 for machine-code Arcade. Though its processing power
makes a good Home Computer. Low Budget, too.

>
> Later on when there wasn't a price premium for CPUs other than the
> 6502, the Z80 got used in all sorts of new budget computers.

You must be joking. The Z80 (and cousins with more MHz and special I/0
etc.) made the greatest turnover of all 8bit CPUďż˝s. Konami, SEGA,
ATARI, Capcom, STERN, Nintendo, Nichibutsu, and so much more ....

Donďż˝t say Sir Sinclair could know this all being, just out of
'Galaxians' - one of the first Z80 Games 1979 (3.072MHz, Sound Samples).
Maybe foreseen, but never known.

Just believe it. His choice to take a z80 was marvelous!

Well, the 68000 is a superb processor but already 32bit and not easy
for anyone but much more capable than i80386 and the rest of the
spaghetti-gang. The z80 is much easier, more effective (see industrial
integrations for the mighty Z80) and highly adaptable, due to
z80-design. Low Power Consumption, Silent, extendable, programmable and
so on.

Best Regards,

Daniel Mandic

Not at all; it has to do with market segment.

The z80 (slash 8080) was the cpu of choice for business
machines where things other than colour / missile graphics
were a priority.

The 6502 was suited for the home / hobbyist market -- its
low cost (a quarter of its competitors' cost when launched)
meant $ could be spent on things like colour, missile graphics /
sprites, sound, etc which were more of a priority for the
home.

The fact that the 65xx was cheaper than the z80 which allowed the
companies to spend more money on the graphics actually does show that
the cpu (the cost of it) did influence the display in a small way.

That could be something... But then again, the Sega Master System had
better color graphics capabilities than the NES, yet the SMS had a Z80
and the NES had (a rather fast) 6502 clone. So no, I don't think CPU
really influenced display type.

There is something nobody has talked about yet. Possibly because it might not have made it out of Winnipeg. M$ made a CP/M card for the Apple//. It worked in my][+, sort of worked with my //e clone, and wouldn't work in my GS. It was intended to be a text only display using the Apple as a display unit. I think someone locally wrote a unit for Turbo Pascal which used the Apples memory to display HGR graphics. I took a look at the calls and figured out how the author did it. The M$ card had a special routine which allowed the programmer to directly access the Apples soft switches. The RAM wasn't on the CP/M card. The card just rearranged the available memory from the Apple and had a limited amount of RAM and I guess ROM to replace what was used by the Apple. The memory was allocated and the unit was a series of routines which built on the plot of a single point. It still displayed graphics in colour.

The whole process was slower than an Assembly program on the Apple, but faster than Applesoft.

Later
Mike

Try running the GS in 1 MHz mode.

There is a version of MBASIC that supports the graphics commands from
Applesoft. I've used it on real hardware (knockoff, not M$ brand).
Doesn't really work well on the //e because CP/M insists on running in
80-column mode.

Given that time period I think you'll find the major reason being the cost
of RAM (circa '78 16K was about $80, by '82 64K-128K could be had for the
same price) and color monitors at the time. Combine that with the general
publics attitude that home computers were just a fad and you can see the
resistance a company would have designing a color system for general use in
those early years.

Acorn Atom, I think.

>> Now there are exceptions to this, but it makes me wonder, did the CPU
>> influence the display?

> Usually the display was handled by a video processor.

True. But the *layout* of the display memory was certainly influenced by the CPU. The Spectrum's screen memory is laid out to take advantage of register pairing when writing character bitmaps (increment the high byte to get to the next line within a character cell), and Acorn's 8-bit machines (at least the BBC and Electron) used a layout such that each character cell used a contiguous chunk of memory (8, 16 or 32 bytes, depending on the number of colours).

The following code shows this (I'm ignoring calculation of screen addresses and, for the Spectrum, the writing of the attributes byte.)

```
; HL points at character bitmap data
; DE points at the first byte in a character cell
LD B,8
.copy
LD A,(HL)
LD (DE),A
INC HL
INC D
DJNZ copy
```

```
; chr (zero page) points at character bitmap data
; scr (zero page) points at the first byte in a character cell
LDY #7
.copy
LDA (chr),Y
STA (scr),Y
DEY
BPL copy
```

[snip]
>> Now it could have been display size, many Z80 computers used 80 columns

Are You referring to me, Sergeant?

If so, I just have to consider the intelligence level of the person calling me stupid, then I feel vindicated...

Do you know what intrinsic value is, Sergeant?

Do you know what commodities are, Sergeant?

Do you have a brain, Sergeant?

Commodities never go to Zero value. Do you know why? It's because they have intrinsic value! What does that mean? It means that the demand for the goods exceeds the cost to produce them. Sugar, for example, has intrinsic value. There is real deman dor sugar so there will always be a market for sugar. It doesn't matter how much it costs to produce sugar, the market will always be there.

Do you want a really good example of intrinsic value? Look at the prices on the gas pumps the next time you fill up your tank. And when you do that, ask yourself what the intrinsic value of oil is?

Anyway, I'm not gonna sit here and explain simple concepts to simpletons that will never understand them. We can't all be born intelligent. :P

So, let me leave you with this snippet from a dream theatre tune:

"The unbroken spirit
Obscured and disquiet
Finds clearness this trial demands
And at the end of this day sighs an anxious relief
For the fortune lies still in his hands."

Yep, I'm good! I'm too good.

Ciao...

5022. XF551 SIO port problems

Newsgroup: comp.sys.atari.8bit
Date: 2005-12-27 01:51:18 UTC
From: MrScout <mrscout@sbcglobal.net>
Message-ID: <1135648278.373550.250060@g47g2000cwa.googlegroups.com>
Source record: 8479

I just got an XF551 drive, and after pluging and unpluging the damn thing a few times, the computer stopped recognizing the drive, unless I put pressure on the plugs. I started looking for a solution on the net, and I guess this is a very common problem... I wish I read that before I was playing with the cables!

Anyway, I opened it up, and tried to reheat the contact points, but it's no use - the traces started lifting off of the circuit board already. I saw somebody suggest that you use thin wires and replace all the connectors that way. Well, my question is - the drive that I have has the two SIO ports connected already, pin by pin, by thin wires. Was that how it came out of Atari, or did somebody already tried to fix it?

Thanks,

MrScout

It's interesting that you would include a link to canadiancoin.com, JR. Did you know that in the thirties, people would literally burn money for heat? The global depression of the time meant that some currencies around the world were virtually worthless. It was cheaper to literally burn the money than it was to buy heating oil. In some countries, coins were used as buttons on clothing because they had less value than real buttons.

Of course, todays money has no real value. It's all arbitrary valuations based on speculation and a host of variables too varied and irrational to even bother trying to contemplate. Although, your link kind of lends credibility to the concept I've presented. As you know, money has a face value, which remains constant, a market value to collectors, an entirely different value on international monetary markets, and... Well, I'm not going to spend much more time on this subject.

Gee, I wonder if I should tell Rick and the Sergeant about the old gold standard? I'm sure they'd probably delight in knowing that gold once had a fixed price and that it was used for determining the value of a nations currency. Money, it does a body good!

Message-ID: <a491r1ta9p2onqhf0vh08o7rknljskvif3@4ax.com>
Source record: 8483

Hi all,

Tomorrow, I am going to put my last MIO on Ebay for a 3 day auction.
Bidding will start at $325 and a BUT IT NOW for $400. Here is the
specs:

1mb MIO Hard Drive, XE adapter and MIO diskette. I dont know if I have
another manual or not. I will look for one, but assume that I wont
find one.

I will also put 1 brand new MIO XE adapter that is still in its
plastic up for auction, 3 days, $50 start or $69 Buy It Now.

If anyone wishes to offer more, email me ASAP before I put it on
tomorrow. Shipping will be determined by address.

Thanks,
Rory

sorry the link didn't go to the page I intended. It was supposed to go
to a definition of the various types of 'value' that can be assigned to
a collectible object such as a coin (or an obsolete computer accessory)

Here is the text of that Definition from that site:

VALUE
- A coin can have as many as five values depending on the context
in which they are used. Face Value is the denomination of the coin.
Intrinsic Value is the melt value of the coin's metallic content and for
gold or silver coins is greater than Face. Wholesale Value is what a
dealer will pay to own a piece for his business for eventual resale.
Retail Value is what a typical collector will pay to own the coin.
Esteemed Valued is the highest possible price that a collector might pay
for a piece and this price is influenced not just by how rare or
non-competitive the coin might be but also by a certain amount of "ego"
and emotion on the part of the buyer, Certain coins with "pedigree" may
also be classed here. See Pricing Rare Coins.

Reading some of the computer history books gives some insight into
that. It depended on the compnay, graphics chips back then were pretty
primitive either TTL logic or if there was sone hotshot designer in the
compnay maybe a chip. Though it took a hundred thousand (or more) to
design a custom chip.

Commodore had the in-house guys from MOS to do the work and developed
thier own chips, Atari had also lots of arcade machine experiece to get
their job done. Apple had color, but conparitively the Apple][
actually had a pretty primitive color system (it didn't greatly improve
until the 80 column board)

CP/M machines were mainly going for the business market and column
space was way more important than color (decent 80 column color
displays were VERY expensive back then) so it was an expense they
probably didn't want to risk putting to the consumer.

The only real spectactualr color 80 column computer then was the
CompuColor II and at something like $3,000 it was certainly one of the
most expensive as well.

It's just color was not a common technology and also it wasn't a cheap
technology to develop from scratch unless you really wanted it. Those
that had it cheap were the ones how did thier magic in-house and went
for mass market sales, those that were more expensive were probably
buying third party video chips at higher cost.

Larry

Ah that's too bad, Sarge. A shrink? Do you think I need a shrink? Why?
Do you want me to be as stupid as you are, Sarge?

Anyway, it's not fair of me to insult you for being ignorant. I suppose
things like intrinsic value, commodities, etc., hold little interest (no pun
intended) for most people. Although, it really is a very simple concept
and I thank JR for printing a more concise definition of intrinsic value.

In the future Sarge, you should read some textbooks from a high school or
something before you discount my ramblings as lunatic fringe logic. Cuz,
quite honestly, you sound like a fucking idiot.

I hope this doesn't get me added to anymore kill files! ;)

BTW: Have you ever noticed how some people have a tendency to tell you that
they're adding you to their kill file? Usually it's someone that wasn't
even part of the discussion. It's sort of like an ugly chick approaching
you out of the blue, and saying that she rejects you. I mean, who the hell
was interested in the ugly chick in the first place? I mean, you're adding
me to your kill list? Uh, yeah... Okay, but who the hell was talking to
you?

I gotta mansize predicament... Goes something like this...

Ever heard those words before? That's how the Kiss tune, Domino, begins. If you're a Kiss fan, you know that Domino is a girl that's too young, but she has a great bum. Apparently.

Anyway, that's not my predicament and I ain't got no girl that's too young. I will admit however, that the Revenge CD was the first CD that I ever bought. It's a pretty damned good CD too! Well, if you're a Kiss fan.

Personally, I grew up loving Ozzy Osbourne. Yep, Ozzy and Atari were my bread and butter as a child. I ate, slept, and drank Ozzy tunes and Atari Computers. Heck, I can't begin to recall all of the times that I would pop my Ultimate Sin cassette into the old Atari 1010 program recorder and have "Killer of Giants" pump through the speaker on my little black & white television. Those were the days! The glory days!

Those days, I hear, are long gone. Or are they? Personally, I think the best days are ahead. I've always believed in fighting fire with fire. I believe in kicking them when they're down... Oops, sorry! I meant my enemy believes in kicking them when they're down. But the enemy is usually loser!

Anyway, the enemy says that they have the numbers. I don't know what they're talking about! I think they're more than just a tad retarded. I think they're downright braindead!

Dear Enemy:

You don't have the numbers! People put there garbage out every Wednesday in this neighbourhood. That's not an army! That's just people putting their garbage out! Think about it!

Here's a link for ya Sargeant Silicon:

http://www.investorwords.com/2587/intrinsic_value.html

Here's the definition that you'll find at the above website:

"The actual value of a security, as opposed to its market price or book value. The intrinsic value includes other variables such as brand name, trademarks, and copyrights that are often dificult to calculate and sometimes not accurately reflected in the market price. One way to look at it is that the market capitalization is the price (i.e. what investors are willing to pay for the company) and intrinsic value is the value (i.e. what the company is really worth). Different investors use different techniques to calculate intrinsic value."

That is a direct quote! If you want to know what market capitalization is, it's the trading value of a share multiplied by the number of shares issued. Note that they are very clear to point out that what people are willing to pay for something is the "market value." The intrinsic value is the real value, or what something is actually worth!

Sorry, Sarge, it's not quite lunatic fringe material. The shit that you're spewing is closer to being lunatic fringe material. :P

There are many places on the Internet where you can find similar definitions for intrinsic value.

Alfred:

> I would do it a bit differently, since I'm not much good with those
> carry bit tricks:

that was no trick ;) that was 16bit number with sign

```
ldy #$00
txa
bpl plus1
dey
plus1 ...
```

Y reg. will hold MSB so if X reg. is positive then we just add 0000-007f,
else we add FF80-FFFF (add with carry two bytes - not a trick).

Your code with for example 120 in X reg. MOD_max_x=159 cursor_x=150
mouse X position is legal within (0,159) and we moving +120
(positive value):

```
> txa
> clc
> adc cursor_x
```

so we have 150+120 which is 14 cause we lost highest bit of 270

```
> tay
> txa
> bmi _negativ ; mx=negativ? yes -> _negativ
```

not executed because it is positive

```
> cpy MOD_max_x
> bcc _lesser_max
```

executed, 14 is lesser

```
> ldy MOD_max_x
> _lesser_max
> sty cursor_X
> rts
```

so we have 150+120 -> 14 - mouse jumped from right side of screen
to the left and should stay at max_x on the right side.

What you are looking for is the FLI mode. You can find code for it at http://www.ffd2.com/fridge/ and in one or more of the C= Hacking issues (don't have an URL handy but Google should be able to find it).

The FLI mode is what you would call a "user mode", it is not an officially documented "hardware mode".

Normally the VIC chip fetches the attribute bytes every 8th raster line and caches them internally. Those rasterlines are called "badlines" because unlike most other memory accesses by the VIC chip, these memory accesses slowdown the CPU. Since the attributes are cached in the VIC chip and only fetched once every eight lines changing the attributes bytes halfway an attribute cell won't have any visible effect.

Fortunately the VIC chip can be fooled so it will fetch the attribute bytes every rasterline by manulating the vertical scroll register so it always thinks there is a "badline" condition. This trick requires cycle exact timing. The CPU in the C64 isn't quick enough to copy 40 bytes of attributes data during a badline, but it can change the memory location of the attribute bytes by writing to a single VIC register. The FLI mode requires a lot of CPU attention, while the raster beam is in an area where a FLI image is displayed the CPU has very little time left to do anything else. In case of a full screen FLI that would mean that on a PAL system there is only 36% processing power left to do other things. By restricting the FLI mode to a smaller part of the screen, more processor cycles can be spend on other activities.

Corection: all text/graphics modes on the C64 support (more than two)
colors.

What you are saying may be true for the spectrum, but is not
necessarilly true in general. The memory layout of the bitmap modes on
the C64 is exactly the same as on the spectrum. The reason is according
to the article below is that way the same circuitry could be used for
character and bitmap modes:

Back in the day I built an external board with 2 MB of SRAM
with 256 X 1's and used it as a ramdisk. Very large and very
cumbersome, but worked great. Recently, I designed and have
produced a 4 MB ram board for the Apple IIgs and I am now
selling my 3rd run of 50 boards. It has 4 x 1 MB simms, and
I am now looking at designing an 8 MB board for them using
2 x 4 MB 72-pin simms. So, what I'm saying is, I understand
your need to do what you are doing.

You can check out all of the products at www.gse-reactive.com

I think you're wrong.

I believe the Spectrum display memory is arranged as it is to simplify the hardware design and save silicon space inside the ULA. This has nothing at all to do with taking advantage of register pairs and such like (That is probably just a side effect of the design). Spectrum display memory is arranged so that only one counter is needed to fetch both bitmap and attribute with a simple 2-to-1 line decoder selecting which.

It's been fixed by a previous owner. At least some of the drives as they came from Atari didn't even have the connectors bolted to the circuit board. I think they started using rivets after the attachment problems surfaced but the circuit board they used was about as fragile as a saltine cracker so it didn't help much.

But my system *is* better than your system! Just kidding.

I think the choice of display type and operating system were determined by the intended market, and the choice of CPU was determined by the OS.

CP/M came out for the 8080 (& later the Z80) because it was used in the Altair, and it was first so it set the standard. CP/M was chosen for business because it left so much RAM for big "business" type applications. 80- collum displays were chozen for business because it's the standard typewriter width. The Z80 was chosen for business because it would run CP/M and because it was better (improved later design, got there before(?) the i8085) and, at least at first, cheaper, than the 8080.

I think the guy who said the 6502 was chosen for the home market because it was cheaper is probably right, and the home market was also where color graphics were wanted.

What about the 6800/09? It was at least technicly superior to many other chips available at the time, and just as good as the rest. Why was it so rarely used? I've noticed many early 680x computers used the realitively poor 6847's b&w predecessor. did that have something to do with it? or was ti just too expensive? or too late?

The 680x processor series were too expensive, which inspired Chuck
Peddle too leave Motorola and develop the dirt cheap 650x series at MOS.

Can't blame the 6809s alone. Commodore made a clone of the 6845, called
the 6545, and used it in the later PET/CBMs (4032, 8032, etc.)

-uso.

I know about the gold standard, and when we came off of it. You must
think no one knows anything but you. All I have said thus far is that
your ranting about values was majorly flawed to the point that I
perceive you as stupid. If that makes you feel that you know
something about the fact that we were once on a gold standard, and the
rest of us don't (thus reminding yourself of your own intellectual
superiority) then go ahead. All it really shows is that you keep
playing the fool. Fool.

> colors.

Right. The C64 has no true monochrome mode. However, monochrome may be simulated (or emulated) on any color system by using white text on a black background, black on light gray, etc.

Or, in other words, selecting only black, white, or shades of gray for the display make the it appear that monochrome is being used while the computer is really in a color mode all along.

Note: Some computers with color capabilities may have an actual monochrome mode available, but not the C64.

According to Chuck Peddle in "On The Edge - The spectacular Rise and
Fall of Commodore," the 6800 costs $300 in quantity and the 6502 cost
$25 in quantity. 'Nuff said.

You amaze me, Sarge. Somebody had confused market value with intrinsic value and I attempted to show the difference. Was anything that I said inaccurate? Absolutely not!

So, if what I said was accurate, how do I look like the fool? It was you and Cortese that were insisting that I was wrong. I wasn't wrong!

Oh, and I mentioned the gold standard because that's when money had intrinsic value. The almighty dollar hasn't had intrinsic value since the gold standard was abandoned. It's also been a long time since we saw $20/ounce gold. (That's the price that gold was fixed at!)

Interestingly enough, gold is still used as a hedge against inflation and economic instability. Do you know why? You guessed it! It's because gold has intrinsic value!

As for why you perceive me as stupid... Well, I'm of the opinion that you're a very simple person and that you're quick to discount anything that you don't understand. Then, like most simple people, you attempt to spin some whacky fable to add depth to your false intellectual facade. Honestly, you remind me of somebody that works for Richard Costly-White!

The Apple I board was designed to take either a 6800 or 6502 CPU, and
the board's legend overlay even shows which components need to be added
to use a 6800. If it had shipped with a $300 6800 CPU though there is no
way in hell the whole computer could have sold for $666.66 retail like
it did!

>the cost of RAM (circa '78 16K was about $80, by '82 64K-128K
>could be had for the same price) and color monitors at the time.

You are low on the RAM price. 4116 RAM was going for $200
at the local electronics wholesalers. I know - I priced it for my
machine. That was mid-1978, as I had gotten my system at the end
of 1977.

When I built a 32K static RAM board with 64 21L02 chips, things
were a bit cheaper - but I still had about $350 into that including
the raw board, all the sockets, the RAM and about 10 glue chips.

> Combine that with the general publics attitude that home
>computers were just a fad and you can see the resistance a
>company would have designing a color system for general use in
>those early years.

The general public didn't think they were a fad - they had no clue
that they existed. On of my early computers books by Dwyer and
Crutchfield had the title of "You just bought a personal what?"
I still see that over on the shelf with some other vintage books.

One of the most presceint of my books was called "The Home Computer
Revolution" - self published by Ted Nelson in 1977. He talked
about how predicting the future in computers was pretty pointless
and everyone would be wrong - but he was persuaded to make his
guess for 10 years in the future - and he came the closest of
anybody in his predictions.

That's one of the 'collectors items' in my computer library.
He worte that book 2 years before another I have called "Literary
Machines" where he talked about computers that you could link any
word to another reference and keep following references that way.

He coined the term 'hypertext' in this book - and 4 years later
Apple implemented about 5% of his concept.

As to color I remember listening to Stan ?? [whose last name I've
forgotten] who had a computer store in NYC and he had a color
display in his window in color - was it the Dazzler - that the
police made him take down after the first day because it was
causing a crowd on the sidewalks. He said that was the first
computer store in NYC. He gave a talk to our local computer club
back in about 1980 - so forgive me for not remembering his last
name at the moment.

On two of my first machines the video really didn't have a lot of
processing. There was a character generator chip and you wrote a
character to a memory spot and it displayed on the screen. Pure
memory mapped without a lot of overhead like we saw on machines
that came along in 1979 and 1980.

I agree, the folks with "1337 mad skillz" are typically losers. I avoid
them too. They're usually just a bunch of self-righteous hypocrites that
know nothing and act arrogantly in some vain attempt to add depth to their
rather shallow intelectual facade.

I'm practically lost in the Linux world too. I know the basics -- just
enough to be able to kind of get something done. But I'm learning, and
that's really the best that I can hope for... Cuz, contrary to what some
might say, I really like to learn new stuff.

>

Are you sure that you want to do that neopeius? You'll probably get more money if you part it out. I would guess that an ANTIC chip could easily fetch $2000 alone from a collector. And those GTIA chips are really hot items right now. Black market distributers in Hong Kong are moving 6502 processors like crazy in the Orient. I hear that the 6502's are sought after by the Martians for use as aphrodisiacs.

You could probably turn that extra 1200XL into a cool $73,000.00 if you funneled the parts through the right channels. Careful with the 64K RAM chips though. Especially if you're living in the U.S. -- I hear terrorists are using them for improvised oven mits. You know, the plutonium and stuff...

Anyway, you're sitting on a goldmine dude!

If you're talking about the "Microsoft Softcard", it had neither RAM nor
ROM on the card. Only a Z80 processor and a good bit of 74LSxx glue logic.

But of course the Apple II dates to 1977, 5 years before the C64 came
out. That is a long time in home compter development.

Ok, so... a buddy of mine picked up a 130XE in a garage sale yesterday for practically nothing. He swung by here on his way to work this morning and gave it to me saying "I knew you'd like this, blah blah blah".

I unplugged mine and hooked it up, it fired up just fine, loaded DOS 2.5, started the RAMdisk and what not. I put it through it's paces with the diag function, all ram and rom passed.

So I cracked the puppy open to see what mysterious goodies might lurk inside. Only thing out of place is a chip centered between the two plastic keyboard stands. This thing has 4 wires soldered to the chip (2 red, 2 black) and they are held in place by a glob of hotglue. It's too long to fit in the socket completely. The chip hangs off the left end of the socket and the top and bottom 2 pins on that end have been clipped off. Any idea what this thing is?

You can see it here: http://67.187.76.221/pics/130xe.jpg

Also, you can see the 130XE I use here: http://67.187.76.221/pics/atari.jpg :)

Thanks,

As for noticing anything different about it, not in the slightest. I havn't farted around with it other than what I mentioned earlier, but it appears to be completely normal, in behavior at least.

And that monitor... lol. It's an old ass Mag Innovision monitor. Used a "A/V A8 Break Out Box" to get an S-video signal, and pipe that through a viewsonic TV to VGA converter box. You can see that sitting on top the desk wedged inbetween the printers and the Sega CDX. :) It produces an uber crisp display. Before this I was using a 13" Sony Trinitron TV I bought from B&C Computervisions a looooooooooooooooong time ago.

Hi David-

Very Interesting... Can you tell us the chip numbers on the mystery chip? Appears to be U4 which should be the BASIC rom. I would say that someone made a custom 28-pin prom (eprom? -- can't tell due to the silicone) and has jumpered it into the 24 pin space of the normal chip. (?)

I already reassembled the case and I'm about to go to bed. I'll gut it again
when I get up tomorrow.

The only thing that's ledgible is the last 3 or 4 numbers on the chip. I'd
have to peel the silicon off the chip to read teh whole number.

I'll let you know what I find.

I'm about 50% confident it is revision C BASIC in a 2764 compatible mask ROM. That is if the computer boots up to BASIC anyway. I used to have a Atari ASM/ED chip in my 800XL and another that booted to Galaxian for my kids.

Most if not all motherboards used the 24 pin mask programed 8k ROM. Some like the 1200XL came with jumpers and extra holes in the motherboard so you could use either type of device for the OS<no built in BASIC> but the XL/XE used the 24 pin BASIC. Only exception I can think of is the XE Game System that had built in Missle Command or something like that so they used a larger ROM.

Atari manufactured both 24 pin and 28 pin BASIC chips for their BASIC carts. My guess is the previous owner either ordered the 28 pin bare replacement chip by mistake or took apart a BASIC rev C cart and added the jumpers to make it work.

Most?
can you list them?
ZX80/ZX81 - B&W
spectrum, amstrad cpc, memotech, enterprise (to name but a few) - colour
(Can't remember what the tandy machines used, if it was z80 the only reason
they were monochrome was because it was the (mainly) pre-colour computer
era)

The Accepted sticker is a red flag for me and makes me suspicious that this is an in house (Atari) substitiution of the standard 24 pin masked ROM for a 28 pin one. Perhaps in the latter days that this one was built, the supplier of that 24 pin ROM ran out and could only supply 28 pin ones, WAG there of course.

This is a 64x4 motherboard (often called an 800XE in Europe?) but it's slightly different than mine as far as the silk screened white lettering goes. Mine has a single A in the 'Ru UPC AA' group and mine also has the word 'action' directly under the three resistors in that same vicinity. Mine has no space between REV.1 and the 2 in the box which allows room for the word 'action' to be directly under the three resistors. Yours also has a solid white box extending out from under the sticker that on mine would be in the exact placement of '-001' of the following second line that is under your sticker:
ASSY NO. CA200519-001
first line being:
130XE(64X4)C103579-001 REV.1

I have a couple other standard 130XEs that have had jumpers placed on the board and it could only have been done at and by Atari. Tracing down those jumpers reveal that they are just duplicating traces that already exist. Another wild guess is that on that run of boards they had some troubles with those particular traces and as a hedge for that, they just had the crew place jumpers on all them. I don't have any signed, Accepted stickers like you do though...

Full Basic ROM numbers for mine are:
C024947A-29
(C) 1982 ATARI
-29 A8913
F834523

ALL RIGHT!!!!

I have the 1 Meg simm up and running!!! PB4 enables bank switching. An 74ls373 mapped to address 54048 selects the banks using bits 2-7. I used bits 0 and 1 for 2 LEDs (just for kicks and testing since I don't have a scope)or I can use those 2 bits for 4MEGS, one day. So right now its giving me 63 16K banks. I think the 64th(or first) bank should be the same as the main, but I think im getting something else there thats not right...I'm not gonna try to correct it. its already too much chips on the board. 63 16k banks is enough :)

I was wrong about not needing to figure out /CAS. I had to use a 5th multiplexer just to handle this issue. I guess it doesnt matter. I'm still gonna have to use ANOTHER chip anyway. I'll get some pics and schematics up soon ;)

Ralph

PS. Thanks for the HOORAHHH!!! nope not Canadian, American from Mexican parents.

The SIO ports on the XF551 are a common fail point.

Anyone using these should take care when removing/plugging
the SIO cables. The Ports are poorly secured.

No. The cost of the RAM was by far more important. There are two
classic cases:

Atari 2600: defeated its competition because it didn't need a lot of
ram to display colour graphics (but programming was complicated).

ZX Spectrum: they reduced the number of colours (2 colors per 8x8 bits
block) in order to require less RAM for displaying the screen at the
same resolution

Evenmore, taking the ZX Spectrum example: it uses a memory-mapped
display, so if you replace the Z80 CPU with a 6500 CPU and write the
same values to the same positions you got the same display no matter
what CPU you use, so, No, the cpu didn't influence the display.

Regards

JF

I know exactly what you mean: the BBC micros had a teletext mode as well as
several pre-defined bitmapped modes - and, the display chip being a 6845,
some scope for custom modes.

The poster is likely referring to the video system used in the
zx81/zx80
which makes special use of the z80 dram refresh features to get
the z80 to generate the video display, and no this can't be done on
any other 8 bit uP. The Atari 2600, as you (Peter) point out also has
simple display logic, but it still uses the TIA chip to general
horizontal
video timing, whereas in the zx80/zx81 the z80 uP does it all --
vertical
timing, horizontal timing and fetching of data to output to TV. The
only
thing missing is the modulator and parallel -> serial conversion. This
was likely the key reason the z80 was chosen for the zx80/zx81, whose
primary purpose was to get a useable computer as cheap as possible.

The dram refresh feature and the bus timing in the z80 did make it
easier to build a system with less glue logic than other cpus,
but early on that cost was easily swallowed by the price difference
between say the 6502 and z80, being the most dramatic example.

> On the other hand the 6502 had a feature that allowed display chips to

> of-the-shelf solutions.

You can do hidden cycle dma access on a z80 too. Ignore the
dram refresh feature and you have 2 cycles of free access for
every instruction byte fetched. You could still use the z80
refresh signals to simplify any dram refresh hw you would
need to add.

The SMS and NES were 1985/1986ish and by that time there
wouldn't have been much (if any) price difference between
the 8 bits.

The OSI Superboard/Challenger 1P was a mono only system. 1KB of video RAM arranged as 32x32 characters (8x8 pixel font) with no guard bands so the software constrains output to a 24x24 region that is visible on a TV screen. No bit mapped graphics, just 128+ character based graphic symbols.

Wow, $200 in 1978! Something big must have happened in the next year
or so. I paid $18 for eight 4116's in 1979/80.

They were used to upgrade my Atari 800 8K RAM module from 8K to 16K.
Doesn't sound like much of an upgrade but I only had 24K total at the
time and Atari 16K modules were $180+ retail.

Yes. RAM prices dropped like lead from 1977 to 1979. It's no coincidence
that the first Apple II came with just 4K of RAM standard in 1977, but
in 1979 the smallest amount of memory you could get with a new one was
changed to 48K.

Or consider the Atari 2600, also released in 1977. It has a whopping 128
bytes (sic) of RAM. Would've made absolutely no sense in 1979.

The Apple I (alright, that one is pretty obscure).

The Commodore PET series (not so obscure).

Aside from the "collectability factor" of older interfaces, I've found that the KMK-JZ IDE hard drive is a great alternative to more expensive options. One of the really nice things about this interface is that the system can use both a Master and a Slave drive. And it is very fast. On my system, I use a 2-1/2" laptop drive as the Master, and for less disk-intensive applications, I use a Sandisk 32 MB compactflash as the Slave. Since laptop drives and CF do not require +12VDC, it really simplifies powering the devices. And since the sizes of the drives is so much smaller, the housing and space requirements are much improved over 5-1/4" and even 3-1/2" drive options.

On the downside, my interface did not come with a cartridge jack. However, I recently discovered that the connecting points are on the interface board, so it can be added fairly painlessly. I plan to do that real soon. It does require require cutting the top of the plastic interface case, but that is not a problem to me. Also, I tried to use an IDE ZIP drive as the Slave to transfer some data, but that resulted in corrupted data. I need to try it with only the ZIP attached (no HD), but haven't done that yet.

I don't know if these interfaces are still being sold, but if they are, you might want to investigate it if you are looking for an fairly inexpensive, powerful, fast HD alternative.

Howdy David

This probably will not help you much, but it looks like the CO25953 and two of the RAM chips have been added at a later moment.

Which, while I am typing this, makes me think that the OS might be replaced by an OS from the XEGS, which has the extended memory test in it.

Why, exactly, would a company that specializes in vintage software need
to run a clearance sale? Are you trying to clear the shelves, waiting for
the new Atari models to arrive for '06? Are you trying to cash in on those
Jaguar games, before these newfangled Playstations get popular?

I'm buying out an Atari Dealer. I have half of his ST Games/Software and I
need to make Room on my shelves. I'm also doing this to help fund a buyout
of the other half.

Hey fellas,

Now a bit of bad news (if you can call it that) when I select bank 0 I get $0-$3FFF at the bank space, and when I select Bank 16 I get $4000-7FFF (like if I wasn't banking) SO WHAT!!!!! I still have 62 16K banks. I just have to remember 2 are invalid. I'm not EVEN gonna try to correct it...62 16K banks!!! thats 20 1/2 800's worth of memory. (Remember I'm 3 wires away from 4 Megs..I just cant find a simm!)

ANYWAYS! Enough RAMbling (ha ha) Tonight I'll start on the harddrive interface (I already have Sijmen's MyIDE in my XL..IT ROCKS!!!) but on the 800 I'm gonna map it somewhere else in memory and use all 16 bits. Once I stick in all the goodies I want in there, and organize, clean up, and get a procedure going, I'll post some schematics and pics

Ralph

Well, tell me this... Is that chip the ROM OS, or BASIC? I've never screwed
with the ROM chips on any Atari. I was looking at the 32-in-1 OS urpgrade
installation instructions over at atarimax.com and it says the OS ROM is the
chip directly above the one in question on my system.

do you think a similar mod could be achieved on the Atari 400?

In January, 1981, California Digital (a component discounter) was
selling eight 200ns 4116's for $30, and that was a considerable
reduction from the "standard" price of about $75 and the Apple price
of $150 for the same set of eight DRAMs. I bought 2 sets.

The price of DRAMs was pretty volatile then, as now. A week after
I placed my order, the price of a set of eight went up to $40.

Of course, the general trend (averaged over a year or so) has always
been strongly downward--until the chip type became obsolete for new
designs. A typical slope is that the price halved every year.

It would have been very difficult to find 4116s for $18 per set of
eight any earlier than mid-1981.

You are absolutely right. After thinking about it a bit I decided that prices dropping from $200 down to $18 could not have happened in just two short years (nevermind less).

I dug out my old A.N.A.L.O.G issues (later Analog Computing) to find the article I used for reference for my memory upgrade. I had two surprises 1) The first issue was published in 1981 not in 1980 as I had thought and 2) the article to which I just mentioned did not appear until issue 6, published mid-1982.

Even then I did purchase the 4116s at half the price I expected to pay. (ELI Electronics of Cambridge MA was quite a place for electronics, new and surplus, at basically wholesale cost).

I appologize to one and all for my faulty claim. The actual date was mid/late 1982.

Steve Sheppard

> CPU.

In the case of the Apple II, the (somewhat unusual) layout of display
memory was a consequence of using the video refresh to accomplish the
refresh of the DRAMs.

The result is that no special refresh circuitry is used, and, since
all video accesses occur on the alternate half-cycles not used by
the processor, there is never any interference with the processor
for video or DRAM refresh.

A little cleverness simplifies a lot.

As Linards points out, the Apple][had color long before the
Commodore computers. And it was able to do so without using any
more memory than for a monochrome display. It's color is all
NTSC "artifact" color--an extremely clever design in 1977,
inspired by video games.

The Apple][video generator is a very simple LSTTL design, using
a 14MHz shift register chip to generate the video signal.

The XEGS uses a single 256kbit ROM that includes BASIC, Missle Command
and the OS rom. They probably ran out of one of the roms and used the newer
combo roms as a substitute, hard wiring it for a single function and the smaller
footprint of the old rom.

I don't agree. No matter what the screen memory layout is, the video circuit will refresh all the DRAM as long as 128 consecutive addresses are accessed (or all 128 combinations of low 7 address bits are used).

The screen layout is what it is for a different reason: the number of characters in one line is not a power of 2.

Suppose you have 64 chars per line. Then the addresses can be consecutive. Same for 32 chars like in Sinclair Spectrum for example. Woz chose 40 chars per line. Memory was quite expensive. To avoid big holes - 24 of every 64 bytes - he used an adder to scramble the addresses so that there are only small 8 byte "holes".

>
> The result is that no special refresh circuitry is used, and, since

This is all true. But will also be true in case of say a 64 char per line display and linear memory.

Of course it is possible to have 40 (or say 80) chars per line and still have linear addressing, like in a VGA card, but that requires a lot more hardware.

From the picture I'm assuming its being used as a BASIC rom. The rom above
the one with the wires is typically the OS rom in the 130XE. You would need to desolder
that and replace it with a socket to use another OS.

> attribute with a simple 2-to-1 line decoder selecting which.

Nope, have to agree with Darren -- the display organization
looks like it was organized to speed up character printing
to me.

Here's the 13 bit counter used to iterate through the
32x192 pixel bytes (8 pixels per byte):

A BCDE FGHI JKLM

The Spectrum generates 16-bit pixel data address
from this:

010A BFGH CDEI JKLM

and attribute address from this:

0101 10AB CDEI JKLM

As Darren mentiones, this allows for fast
character printing.

But I do not believe this is a coincidence because
there are 12! possible display arrangements using
a 13 bit counter and 32x192 pixel resolution without
causing any holes in the memory organization.

Here's a possibly useful alternative that seems much
more straightforward than the one chosen by
Mr. Altwasser:

pixel address from:

010A BCDE FGHI JKLM

attributes from:

0101 10AB CDEI JKLM

If this arrangement were used, pixel
bytes 0..31 would be at offesets 0..31,

pixel bytes 32..63 would be at offsets
32..63, etc. IE the pixel display is
stored left to right, top to bottom with
incrementing downward one pixel achieved
by adding 32 to the display address,
and moving right 8 pixels (one pixel byte)
achieved by adding one to the display address.
No screwy organization as seen on the
Spectrum.

Attributes would map as expected, left to
right, top to bottom one attribute for each
8x8 pixel group.

I think fast character printing was pretty much
essential for the Spectrum, given its built in
editor liked to erase the screen and redisplay
listings frequently.

Alvin

>
>
> What's "artifact color"?

Color which is displayed as a result of a monitor's interpretation
of a pixel pattern which is synchronous with the color subcarrier
frequency. It is often seen as false color appearing when a fine
vertical monochrome "grating" is shown on an NTSC monitor--like
a finely striped tie, shirt, or coat.

Several machines harness this effect to produce color displays.

It can also be envisioned simply as a digital synthesis of a
combined chrominance/luminance composite video signal, but the
usually very simple combination of patterns of fixed-width,
bi-level pulses at a multiple of the subcarrier frequency, in
which the pallette of colors have simple phase relationships,
is normally described as "artifact" color.

Still having my mind on this, here's an organization
that beats Mr. Altwasser's for screen printing
speed:

pixel byte address:

010A BCDE IJKL MFGH

same attribute organization.

Character printing:

; hl = top of character bitmap
; de = address of top pixel byte
; in 8 pixel high character

LDI x 8

after this de = address of top pixel byte
for next character cell to right (ie all set
up to print next character).

Here's a print at calculation:

; a = row char coord (0-24)
; l = column char coord (0-31)
; exit: hl = address of top pixel byte
; in char cell

or $40
ld h,a
ld a,l
add a,a
add a,a
add a,a
ld l,a
ret

Mr A, you should have been thinking LDIs
instead of register pairing :-D
```

As Alex points out, a linear mapping would do this as well.

His point is well taken--the Apple II display mapping is motivated
by the desire to display 40 characters/280 pixels per line while
leaving as few/small holes as possible and using as little logic
as possible. DRAM refresh is not a primary consideration, since
its requirements are easily met by many mappings.

Nevertheless, the "alternate cycle free" 6502 memory usage,
coupled with a simple "DMA" video generator, negates any perceived
advantage of the Z-80 in a DRAM-based personal computer.

http://search.ebay.com/_W0QQsassZbobbyisgoinghomeQQhtZ-1QQfrppZ50QQfsopZ1QQfsooZ1QQrdZ0?

Great for resellers or homebrewers who need cartridge shells. Many
games for only $1 or less.

All the games are NEW, boxed + instructions.

ATARI 800 XL/XE games are NTSC.

Some controllers, Paddles and Keyboard Controllers available, too.

Shipping of games can be combined.

I can accept paypal as payment and I will ship worldwide.

I started to point that out several times, but thought I would wait to see
how long it took for someone else to do it. ;-) Thanks for restoring my
faith in Commodore users! :-)

I would like to add the 40 column mode of the C128 to your list. The C128's
80 column mode may not count as the 80 column VDC used its own RAM, much like
the PC video cards of a decade ago.

Can't remember if the other commadore monitor was a 1084 for sure but it was better then the 1702. The only thing the 1702 had over the 1084 was a better speaker/sound IMO.

The one I had included jacks for IBM/CGA and composite. It got used a lot on my Tandy.

>
> Several machines harness this effect to produce color displays.

The IBM CGA cards did this; by turning the color burst on in the CGA
640x200x2 mode, you would get 160x200x16 graphics if you used the CGA card's
composite output. If you were using a RGB monitor, however, you would just
get the 640x200 graphics. The composite color palette was different then the
RGB palette; it was similar to the Apple II's color palette. This makes
sense, given that the CGA composite signal was generated almost the same way
as the Apple's video signal.

However, most PC users had RGB monitors, and so got ugly 4-color graphics.
Of course, not every game supported the 16-color composite mode, and often
you got 4 colors even with the composite output. This was partly because of
most people using RGB monitors, but also because it required more effort to
program. Morever, some clone CGA cards(eg. the AT&T 6300 video cards) didn't
have a composite jack.

But you guys missed out the important part of the original quote:

"Of course it is possible to have 40 (or say 80) chars per line and still
have linear addressing, like in a VGA card, *but that requires a lot more
hardware.*"

In the case of the C16/+4 a custom TED Chip, the C64 uses the custom VIC-II,
the Atari it's custom Antic chip. Try designing a video circuit in discrete
logic (Like the Apple II) then tell me how much more hardware is required to
obtain a linear 40 or 80 column mode.

Just take a look at the schematics of the first Commodore PET 2001.
There are probably more examples, but this is first one I could think of.

you might want to investigate it if you are looking for an fairly
inexpensive, powerful, fast HD alternative. <

Last Update (probably)

I was advised that these interfaces are still being sold in parts of
Europe. Note that this is slightly different than my interface, using
easier-to-find components. Mine is one piece, and this one is a
two-piece design with a cable connector. It appears to include the
cart jack built-in. Here's a link:
http://www.allegro.pl/show_item.php?item=79158011

Incidently, that price would be in the $41-$42 range in US$

I still have large qts. of ATARI 800 XL/XE carts One on One and a few
others.

www.atari2600.de/c/oneonone.jpg

New and shrinkwrapped, over 100 copies available, perfect for resellers
or homebrewers who need cheap XE carts for modifications.

I offer 100 of them on ebay for $170 = $1,7 / game

http://cgi.ebay.com/ATARI-800-XL-XE-100-x-One-on-One-cartridge-NEW_W0QQitemZ8247119860QQcategoryZ62053QQrdZ1QQcmdZViewItem

There is another lot of 6 XE cartridge different games :

http://cgi.ebay.com/ATARI-800-100-ATARI-XL-XE-cartridge-games-NEW_W0QQitemZ8247119807QQcategoryZ62053QQrdZ1QQcmdZViewItem

I can also sell these games without ebay, please ask for prices.

Shipping is overseas, a little bit expensive, but insured and usually
pretty fast, takes onl 2-3 weeks to arrive.

32 Euros ($37) up to 5000g
42 Euros ($50) up to 10000g
62 Euros ($75) up to 20000g

A single XE game weighs about 110-120g, depends on the game.

If you're interested, please bid on the ebay items or write to
ulrich_sternaxe@gmx.de

Greg mistyped. That's atarinews.org, not .net. The Atari chat is every Tuesday night, starting at 9 pm Eastern Time. The login is bbs, the password is also bbs. You'll then be asked for a user name and password. Then press Enter ("Return"), then "T" (for "Talk"), "Enter", "C" (for "Chat"), "Enter", and a Chat ID. That'll get you in the room - the rest is up to you.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Well throughout the years many have speculated what Atari could have done differantly that would have kept it going strong for years to come. After doing some thinking this is what I came up with.

Well, lets start with the 5200 system. It was an ok system, but it seems after the release of the 5200 things started to take a slide downward for Atari. If they did things differantly with the 5200 would it have helped Atari out? Well, Atari did invest tons of money into development of the 5200 only to hack up an Atari 400 in the process. I think the 5200 should have been compatable with 400 carts from the start. Maybe add some goodies to keep the 5200 very compedative against Coleco and maybe even survive the game crash. Give it stereo sound with something like a Pokey2. Same great pokey, but with 4 channel left and right. Maybe even add something for digitized sound like Covox upgrade did on the 8-bit. Give it a controller like the 7800 had, but add the pause button. Make the keyboard an add-on device. Don't need fancy full stroke keyboard, after all it is a game machine ;) Also add an audio cassette port for STANDARD home tape players. Imagine game saves, or buying new levels for your favorate game. It would be a supercharger done right. Hell even make it so you can boot 400 tapes as well, or make some el-cheapo games on tape. Higher baud rate wouldn't hurt as well. Forget disk drives at that time. They cost way too much, and if you could afford one, well most well get a computer as well. Leave on the 4 joystick ports.

Next the 7800. Well, if that 5200 would have gone off without a hitch would there have been room on the market for the 7800? Maybe 2600 fans would have thought so. So, for the love of god, give it a damn Pokey Chip, add in extra 16K of ram, and release it in 84 already.

8-bit computer lime. Well, the XL line was ok, but could have uded some tweaking as well. Add in a Pokey2 chip, and digitized audio, but have one more system that would have been higher up than the 800XL. This one would have 128kram at least, or maybe even 576k. Built in 80-col chip, seperate antic banking like the 130XE, Function keys like the 1200XL, but full stroke. And let the 1050 be a DSDD drive. then let this be the end of the 8-bit line, and drop the XE one then.

As far as the ST line, well good idea on paper, but it should have been scrapped. Atari's option would have been beg Amiga for forgiveness, if not, then upgrade the 8-bit line to a 16-bit. 65016 CPU, enhanced Antic chip, for more colors, and for sound the Amy chip. This system would be mostly compatable with 8-bit stuff, but ofcourse, not 100%, and still would have given Commodore Amiga a good run for it's money.

Then the XE game machine, would this be needed anymore with the better 5200? Well, maybe as an update. That would be the time to give it a disk drive port, 64K, full stroke keyboard, and maybe even an Amy chip, and updated Antic Chip. Look out NES!!

Just some thoughts of what SHOULD have been

5147. Re: would this have saved atari?

Newsgroup: comp.sys.atari.8bit

Atari made so many mistakes, it is difficult to try to pick and choose,
but...

In my opinion, the 5200 should never have been. It was a rush job by
Atari to try to buy them a bit of time (not sure where you get the idea
that they invested tons of money in it, since it was basically an Atari
400 in a new case). They should have gone directly to the 7800
instead, since it offered backward compatibility -- it was really an
improved 2600, while the 5200 was a whole new producte line. Of
course, Atari should have discontinued the 2600 after releaseing the
5200 and 7800, but they couldn't break themselves from that revenue
stream. So they ended up supporting too many machines at the same time
and confusing consumers as well.

But at the end of the day, hardware doesn't matter much. it's all
about the games! Atari simply stopped developing new games that people
wanted and instead tried to rely on remakes of their old titles. That
was their ultimate mistake.

5149. Atari to s-video+sound cables

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-02 22:00:29 UTC
From: MrScout <mrscout@sbcglobal.net>
Message-ID: <1136239229.145146.206460@o13g2000cwo.googlegroups.com>
Source record: 8306

I currently have a DIN to 4 RCAs cable from Best Electronics, which is connected to a 2-RCA to s-video cable. The whole thing is like 12 feet long, and I'm sure I would get a better signal by having a short, straight connection to s-video.

Does anybody know if I can buy a cable like this anywhere? I know I could build one myself, but I want to get a nicely done one...

MrScout

My personal favorite is this:

http://www.a8maestro.com/sites/mtgcat/proda8/eh0101.htm

It is very well made and produces the best quality S-Video I've seen with
my Atari. If you have an 800XL (no chroma output), you can still produce a
somewhat lesser quality S-Video (still better than composite) by crossing
the video and chroma jacks with a short cable.

Originally, the 5200 was a project by Nolan Bushnell's Atari to replace the 2600 after a couple years...and by that I mean the 2600 was not suppose to have a long life span as it did. (While it was great that there were a lot of carts that pushed it way past it's limits, the glutteny of those same carts helped lead to the Crash.) But when Ray Cazar took over, he scrapped the project and then changed it to the 400 computer to compete with the Apple II. The 5200 was brought out of mothballs to comepete against Intellivision and later ColecoVision and the blotched up changes were made by marketing like the bizzare controller and the fact that you can't just play 400 carts without redoing the whole coding dispite being virtually the same machine.

So had Bushnell gotten fired by Warner then most of Atari's game made in the early 80's (Asteroids to Yars' Revenge) would have been on the orginial 5200 while the 2600 line up would have ended in the 70's. Might have this prevented the Crash? Probably since Atari would have "renewed" the game system cycle and there would not have been the big glutteny of bad games. They 'might' have added a keyboard and stuff to make it a home computer to compete against the Commodore 64, but who knows. (Would have kicked their butts anyway if Atari came out with the Amiga... ;)

From: Jack Tseng <tseng4@hotmail.com>
Message-ID: <oTluf.38968$QW2.24314@dukeread08>
Source record: 8311

I noticed Atari DOS 3.0 that supports two formatted density, Single and Double. Is Double Density true ? or Enhanced-Density? I got confused!

Atari DOS 3.0 formats 1024 bytes per block. Is it true? I think DOS 3.0 has alot of wasted space. Is it same as Atari DOS XE 1.0?

Atari did develope a seperate system to replace the 2600, but it
proved too difficult to program and that is why they went with the
400. As far as competitive with the Colecovision, the 5200 is
techinically the more system, and regardless of anyones opinion it was
competitive the main problem with the 5200 were the horrible
controllers and of course timing (the videogame crash) but if they had
reelased it with decent controllers it would of done much better.

>
>Next the 7800. Well, if that 5200 would have gone off without a hitch

>Chip, add in extra 16K of ram, and release it in 84 already.

If they released the 7800 in 84 and put full support behind it maybe
they would of had a chance, but the Tramiels prob didnt have the
resources or desire to support that platform. A better alternative:
If Atari had gone ahead and rebranded the NES as an Atari... they
really blew it by turning Nintendo down.

>8-bit computer lime. Well, the XL line was ok, but could have uded some
>tweaking as well. Add in a Pokey2 chip, and digitized audio, but have

>but full stroke. And let the 1050 be a DSDD drive. then let this be the
>end of the 8-bit line, and drop the XE one then.

Atari actually had plans for 65xe with an advanced sound chip. They
also designed the 1400xl and 1450xld which had many of the features
you are talking about. It's easy to look back and say they should of
added all these features, but rem by this time 8bit computers were low
end cut throat priced machines (mainly due to commodore 64) and atari
was not going to make a super 8bit that would compete with the 520ST.

The XE line was basically a redesiged cheaper to manufature XL's, so I dont any reason to drop them.

>As far as the ST line, well good idea on paper, but it should have been >scrapped. Atari's option would have been beg Amiga for forgiveness, if >not, then upgrade the 8-bit line to a 16-bit. 65016 CPU, enhanced Antic >chip, for more colors, and for sound the Amy chip. This system would be >mostly compatable with 8-bit stuff, but ofcourse, not 100%, and still >would have given Commodore Amiga a good run for it's money.

When you say advanced 8-bit, you are basically describing an Amiga, which is the real successor to the Atari 8bit. Compatibility with 8bit would not have been worth it. Atari blew it again by letting Amiga slip thru their fingers, but who knows if they would have driven that platform into the ground worse then Commodore...

>Then the XE game machine, would this be needed anymore with the better >5200? Well, maybe as an update. That would be the time to give it a >disk drive port, 64K, full stroke keyboard, and maybe even an Amy chip, >and updated Antic Chip. Look out NES!!

the xe game system had a drive port (SIO, 64k and full stroke keyboard but it was just cobbled together to try to capitlize on their 8bit inventory and the NES popularity... Atari just didnt seem interested in updating the 8bit line at all. IMO Atari could done would of been able to compete with the NES at that point, they could of however worked on a 16 console and get that out for the next gen (maybe even STE game system) which might of had a chance.

Dos 3 was single and enhanced densities - no true double density. Yes it
wasted a lot of space with those 1k blocks - it was a real dog, IMHO, the
worst one ever produced.

I think they should have released something like the 5200 as soon as the GTIA chip was finished. But it should have been simply a low cost A8 computer for games. Lose the keyboard, SIO port, and other unneeded things but retain compatibility with as many existing cartridges as possible. Making developers have to release separate versions of games for the 5200 and A8 when the capabilities of the systems were the same was definitely lame.

Nah, I think the NES would have been a better bet. Either way, I think Atari should have been looking beyond 160x200 displays and shared 1.79MHz 8-bit buses at this point.

An updated A8 would have been (would still be?) cool. Throw the '816 in there running at twice the speed and give ANTIC a 16-bit bus to RAM and it would be almost to the Amiga's level, but with linear and character-based

graphics modes instead of planar.

Combine the 7800 with the Amy sound chip would've been an NES killer. The
problem with the 7800 is that they didn't upgrade the sound from the 2600.

The 5200 should've never been made, and the resources for the XL line
should've been poured into the 7800. Drop 2600 compatibility, but make
it fully 8-bit computer compatible. Atari's mistakes could fill a book,
but their biggest one is not investing in R&D. The 8-bit line was essentially
unchanged from 79-92!

5163. Atari System Reference Manual - Missing Text

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-03 17:37:30 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <pan.2006.01.03.17.37.29.845446@strotmann.de>
Source record: 8320

There are multiple copies of the Atari System Reference Manual (Bob DuHamel, 1987) around in the internet, and all have some text missing in Chapter 15 Displaylist:

CHAPTER 15

DISPLAY LISTS

[some of this file was lost...]

chip also has a memory scan counter. This register scans the display buffer for data to be interpreted and displayed. Once loaded, the memory scan counter's 4 most significant bits are fixed. The result is that the memory scan counter cannot cross a 4K memory boundary (i.e. $AFFF to $B000) without being reloaded.

DISPLAY LIST INSTRUCTIONS

I have found the original text on some disks:

CHAPTER 15

DISPLAY LISTS

The program which runs the ANTIC chip is called the display list. Much like a microprocessor, the ANTIC chip has a program counter, called the display list counter.

The display list counter is a 16 bit register. However, the six most significant bits are semi-fixed. These bits can only be changed with a jump instruction. The result of this is that the display list counter cannot cross a 1K memory boundary (i.e. $A3FF to $A400) without using a jump instruction.

The ANTIC chip finds the address of the display list in DLISTL [$D402 (54274)] and DLISTH [$D403 (54275)]. SDLSTL [$0230 (560)] and SDLSTH [$0231 (561)] are the shadow registers for DLISTL and DLISTH.

The ANTIC chip also has a memory scan counter. This register scans the display buffer for data to be interpreted and displayed. Once loaded, the memory scan counter's 4 most significant bits are fixed. The result is that the memory scan counter cannot cross a 4K memory boundary (i.e. $AFFF to $B000) without being reloaded.

If you host some version of this manual, please update you version ;)

Best regards

Carsten Strotmann

It wouldnt of mattered if the 7800 had better sound, it still would of
had the same library and came to the party too late. NES was an
unstopable force by the time the 7800 was released. IF Atari could
of got the 7800 out there instead of the 5200, well then maybe they
would of had something.

The problem is once the Tramiels took over they were focused on
beating Commodore and the ST line, so we would never see any advanced
8bit (like the c128 or Apple IIgs) for fear of competing with the
520st. Also they would never fully get behind game system, with the
7800, xegs, and lynx it seemed after the first year when it was clear
they didnt have another 2600 on their hands, they would half heartily
support the platform. It wasnt until the Jaguar they really focused
the company on videogames, but by then it was too little too late.

5166. DarkForce! Announcement

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-03 21:07:16 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.01.03.21.07.16.894447@charter.net>

(newsgroups have been down here - been trying to post this for 3 says!)

First of all, Happy New Year everyone! :-)

We're trying to kick things off right at The DarkForce! BBS, so in the spirit of the season, we are continuing our tradition of monthly prize giveaways.

This month, January 2006, one lucky Atari caller will win a free subscription to ST Magazine. Also, since its almost NFL playoff time, this months featured game is AFL Football! The lucky winner of this game will receive a $25 cash prize. Slots are limited to the number of teams available so don't be left out. Also, rumor has it the Sysop is playing...who doesn't want to take a crack at bashing the Sysop? :-)

Good luck everyone! :-)

Folks, the AFL tournament playoffs on the DarkForce! BBS begin in only 7 days...

Winner takes home $25...just like that.

When was the last time you got paid to have fun? :-)

I concur. The XEGS should've never been released, and the 7800 and Lynx
should've been marketed harder. In fact, everything should've been
marketed harder!!!

Enhanced density. DOS 3.0 was widely criticized. Wasteful, and not very
compatible with older 2.0 disks. Go with its successor, DOS 2.5. Or, if
you want double density, go with MyDOS.

That reminds me... I remember reading an article a long time ago that due to
the rather lame sound of the 2600/7800, some game makers actually put an
enhanced sound chip in the cart right along side the game. Wasn't it the
POKEY, same as the computers?

Not that much in fact. Basically you just need 2 sets of counters: one to
count character positions in a line, say modulo 40.
Then the lines etc. The other is a straight binary up counter for linear
addressing. We are talking about some 4 chips extra
of standard logic. $1 or so in parts, but they need to be routed on a board
too.

In comp.sys.atari.8bit KMK <draco@obta.uw.edu.pl> wrote:
> No, it really does. Alternating these modes you get sorta 8-bit per pixel and
> full 256 colors in 80x96 (or 96x119 if preferred). However, this trick only
> works on PAL TV.

You've described APAC mode ("Any Point, Any Color"). Alternating each
line between 16 hue mode and 16 greyscale mode gave you 80x96 "pixels"
(the interlacing was quite obvious), which kind of looked like 256 colors.

There's also a higher resolution variation of APAC mode which actually
alternates two screens, one with the hues on even lines and greys on
oddl ines, and the other with the opposite. That gives you 80x192, 256
colors, with a little flickering.

This provided a kind of washed-out representation of the Atari's true
256 colors (i.e., compare it to a solid, non-flickering screen of shades
where the shaded pixels' hues are actually changed via DLI, rather than
combined with other hue pixels by your eyes' persistence of vision).

After that came ColorView mode, which didn't use the 16 hue mode, but
instead interlaced 3 screens containing 16 shades of red, 16 of green and
16 of blue. That gave you 80x192, 4096 "true color" colors, with some
flickering.

Mostly, you'd notice large solid primary light colors (like a section of
solid red) kind of rolled a little, as the screen rotated between the three
images.

More recently, we got HIP (Hard Interlaced Picture) which is something like
~160x192 at 30 greys hades, and RIP, which is similar but provides colors.
I cannot recall its specifications, other than ~160x192, as well...

Also note that none of these tricks "only work on PAL". In fact, since NTSC
displays update more quickly, the interlacing/rolling artifacts are _less_
noticable on NTSC than on PAL.

I'll provide a little summary of the modes (that I understand), based on
how the Atari shows them:

* Regular APAC (80 x 96, 256 colors)

Line 1: 80 GTIA 16-shade mode (80x192) pixels across
Line 2: 80 GTIA 16-hue mode (80x192) pixels across
Line 3: 80 GTIA 16-shade mode (80x192) pixels across
Line 4: 80 GTIA 16-hue mode (80x192) pixels across
...

Lines 1 and 2 together represent the first of ninety-six 80-pixel-wide rows
of APAC 256-color pixels. Lines 3 and 4 represent the second row... etc.

Display List Interrupts (DLIs) are used to switch the GTIA chip between
the two GTIA modes.

Unfocus your eyes a little and the pixels blend together to kind of show
256 possible colors. :^)

* High-res APAC (80 x 192, 256 colors)

First Frame:
Line 1: 80 GTIA 16-shade mode (80x192) pixels across
Line 2: 80 GTIA 16-hue mode (80x192) pixels across
...

Second Frame:
Line 1: 80 GTIA 16-hue mode (160x192) pixels across
Line 2: 80 GTIA 16-shade mode (160x192) pixels across
...

The First (shade) and Second (hue) frames of Line 1 blend together
(thanks to Persistence of Vision) to form the first of
one-hundred-and-ninety-two 80-pixel-wide rows of Hi-Res-APAC 256-color
pixels. Ditto for the two frames of Line 2... etc.

DLIs are used to switch the GTIA chip between the two GTIA modes.
Vertical Blank Interrupts (VBIs) are used to flip between the two frames
every 60th (NTSC) or 50th (PAL) of a second.

* ColorView (80 x 192, 4096 colors)

First Frame:
Line 1: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted red
Line 2: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted green
Line 3: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted blue
...

Second Frame:
Line 1: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted green
Line 2: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted blue
Line 3: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted red
...

Third Frame:
Line 1: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted blue
Line 2: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted red
Line 3: 80 GTIA 16-shade mdoe (80x192) pixels across, tinted green
...

The First (red), Second (green) and Third (blue) frames of Line 1 blend
together (thanks to PoV) to form the first of one-hundred-and-ninety-two
80-pixel-wide rows of ColorView 4096-color pixels.

The First (green), Second (blue) and Third (red) frames of Line 2 blend
together (thanks to PoV) to form the second of one-hundred-and-ninety-two
80-pixel-wide rows of ColorView 4096-color pixels.

...etc.

DLIs are used to switch the the palette between red, green and blue
on each scanline. VBI are used to flip between the three frames
every 60th (NTSC) or 50th (PAL) of a second.

PS - There are also two additional ColorView modes: 160x192, 64 colors
and 320x192, 8 colors. Same trick, different Atari hardware modes.
(Either three frames of 160x192, 4 colors; or three of 320x192, 2 colors.)

PPS - These modes aren't used often outside of demos and GIF and JPEG decoders
and viewers on the Atari. They eat a lot of memory. (APAC takes about 8K.
Hi-Res APAC takes about 16K. ColorView takes about 24K.)

Ditto, thanks Jason! :)

> - You mentioned that Atari is incapable of displaying more than two
> shades of one color on one scan line in hi res,

If you overlay sprites, you can have two shades of five colors, or 10 colors.
But you're limited to where and how you can place the sprites.
(They can be up to 4x-as-wide-as-usual, which causes each of the 8 pixels
in a sprite to be as wide as 8 hi-res pixels.)

There's also a cycle-counting trick, combined with a bug^H^H^Hfeature of
the video chips that allows the Atari to switch fro "hi-res, 2 shade" mode
to "low-res, 16 shade" mode, mid-scanline.

This has been done in demos, for example, to show high-res text on the
left, with morphing photographs on the right.

<snip>
> Is that because you cannot change the color registers fast enough,

Yeah, it's hard to change the color registers mid-scanline. Mid-scanline
tricks (like the one described above) are typically just that... they only
work at around the middle of the screen. And don't put too any pixels
in the middle there, or it might not look right part of the time.

> or because you cannot sync the change in the color registers precisely? As
> far as I understand the C64, you can have two colors in each 8x8
> region, right?

The C64 has this 8x8-region thing that I don't understand so well. :^)
On the Atari, the playfield is a large array of memory, and the 'indirection'
comes by way of the color palette. On the C64, it looks like the large
array of memory is _also_ affected by a smaller array (1/64th the size or
less?) of "what kinds of colors go in which 8x8 region".

:^)

> - As far as speed of the machine is concerned, C64 is at 1MHz, and in
> low intensity situations there is one "bad" line every eight scan
> lines. The Atari's CPU on the other hand gets interupted by ANTIC on
> every scan line,

Well, unless that scanline is "off". (Bob Puff's SuperARC and SuperUnARC tools, for example, simply showed a few lines of informative text in the middle of the screen while they did their compression or decompression. The rest of the screen was "border", meaning the CPU wasn't interrupted.)

> but the CPU goes at 1.7MHz so I would assume that it
> still means you have more clock cycles available on the Atari to do
> stuff during the H and V blanks, right?

That sounds right, but I'm not a C64 expert. :^) (And, of course, how much time you had during VB depending on whether you were on a PAL or NTSC system, which led to all kinds of annoyances when trying to watch cool European demoscene stuff on a US Atari ;^) ... fortunately, if you have a good monitor with VHold, you can just plop a PAL ANTIC in and things work great!)

Hi,

> I'm assuming that as the graphics get more complex, the Atari will
> start stealing even more cycles than the C64, so the difference will
> get smaller.

No, it doesn't. Actually, the standard 40x24 text mode is the most
complex mode because it requires DMA for hi-res graphics and DMA
for character cells. All other modes are either bitmapped, meaning that
there is no character cell DMA, or have a lower resolution, and thus
require less DMA cycles. Concerning DMA, the antic modes 2 and 4
(basic modes 0,12) are identically complex, followed by the modes E
and F (basic modes 15 and 8), which have the same resolution as 2 and 4,
but are bitmapped.

Games typically used the mode 4, or the text-mode 6 and 7 which are
both "cheap".

Concerning your calculation, you would need to add the DMA cycles required
to fetch the display list (one or three slots, depending on whether the
memory scan counter is to be reloaded) and 4 to 5 slots for Player/Missile
graphics. Memory refresh cycles can be potentially delayed/overloaded by
other cycles, so the calculation isn't accurate either. It's harder than
one might believe.

So long,
Thomas

In my experience the XEGS already has the best composite video of at least
the 1200XL and the 800.

It's crystal clear on an HDTV. Not sure if any mods were made for it.

I loved it when people mange to push 8-bitters beyond their perceived
limits. Are there Atari emulators that are accurate enough to display
these demos ?

> <snip>
>

I guess that should be possible in the C64 as well but don't recall ever
seeing it done. Probably because there is no real need for it on a C64.

>>or because you cannot sync the change in the color registers precisely? As

> less?) of "what kinds of colors go in which 8x8 region".

Almost correct. In hires mode (320x200) the screen is divided into 8x8
pixel blocks. For every 8x8 pixel block there is a byte that defines the
two possible colors in that pixel block. The upper 4 bits of determine
the foreground color (pixel on) and the lower 4 bits determine
background color (pixel off) of the associated pixel block. So besides
the 8000 bytes of the pixel data, also is 1000 bytes of color data.

The multicolor hires mode (160x200) uses two bits for each pixel which
is twice as wide as a "hires" pixel. Multi-color pixels are organized in
4x8 pixel blocks. For every pixel block there is not only a color byte
but also an additional color nybble. So every 4x8 pixel block has 12
bits of color data associated with it. Those 12 bits are sufficient for
defining three colors, the fourth color is the background color which is
shared across the screen (of course it possible to change this color
every line).

If you feel that 2 color for 8x8 pixels is a too limiting and that 4
colors for 4x8 pixels still not good enough enough, it is possible to
fool the VIC chip so it allows more colors per pixel block. However this
requires a lot of CPU cycles; while rasterbeam is between the top- and
bottom borders the CPU will be fully occupied with the VIC chip.

Another way would be to use sprites to overcome the color restrictions
of the C64.

>>- As far as speed of the machine is concerned, C64 is at 1MHz, and in
>>low intensity situations there is one "bad" line every eight scan
>>lines. The Atari's CPU on the other hand gets interupted by ANTIC on

> tools, for example, simply showed a few lines of informative text in the
> middle of the screen while they did their compression or decompression.
> The rest of the screen was "border", meaning the CPU wasn't interrupted.)

Also the C64 runs faster when the screen is turned off (only the border
color is shown in this case). Like the Atari it also possible to turn
off only a part of the screen using raster interrupts, though that would
waste some CPU cycles (for the handling interrupt and setting up the
VIC). I doubt it would be worthwhile on a C64 since the VIC steals only
a little over a 1000 cycles of the ~20000 cycles each frame has.

>>but the CPU goes at 1.7MHz so I would assume that it

I think Atari800 can finally handle this. Atari++ probably too, as well.

Hi,
I have done this but it gives headache's.

With DiskRX modify the Boot Sector byte offsets for length of partition.
Then run Cleanup (sp) the SDX program that cleans directory errors. VTOC ..
Reboot and delete all files except 33a.dos. After a couple of months and a
lot of copy file problems. I went back to 16 meg partitions. Then later I
heard that MyIDE has a copy bug problem across partitions. But I never went
back to smaller partitions. I do most of my work with MyDos and only use
the 33a partitions when doing SpartaDOS programs.

> Let me tell you WHY the 800 failed and why the C64 is so much better:

Because the C64 sold more, so more and better games (that "and" is not redundant -- both better games and more games) were released for the C64, and with more and better games released for the C64, more C64 were sold.

Kind of like Micro$osft windows today.

As far as explaining after the fact why the C64 was a hit, bit fat hairy deal. Its explaining before the fact what is needed to make a hit that is a big deal. Clearly Commodore lost that ability shortly after the C64 was released.

So get out of here :) and BTW C64 sucks :P
Best example how to f..k-up a home computer with
great possibilities. Look at C64 OS and the computer
itself (design) makes me want to throw up :),
altough hardware is good (except ports, which
will burn by smallest electrostatic shock).

You are totally right and fair.

The Atari 800XL suffers from the same problems that modern PC's suffer from: backwards compatibility. Like every PC has to be backwards compatible with the original IBM AT (and even the XT), the Atari 800XL had to be backwards compatible with the Atari 800 and Atari 400. This is a brake on any new technology. Never trust anything that has the word 'backwards' in it.

And it was badly done too, because they hardly added any new stuff when going from the Atari 400/800 to the 600XL/800XL. It was mostly integration of the chips to get the costs down.

But anyway, you could have kept you post a lot shorter. The argument of the 8 sprites is enough to make the C64 come out on top.

And the argument of the C64's BASIC is only partly true. Stick in a Simon's Basic cartridge, and the machine destroys any Basic ever run on any Atari. You can also load Simon's Basic from tape or floppy.

No, not really. If speaking the truth is regarded as trolling these days,
then something must have gone horribly wrong.

Read the magazines of the 80's. I don't think Commodorus thought up even 1
of his arguments himself. They can all be found in articles of the 80's.

Actually, Commodorus is kicking an open door.

While I could really care less about which system is better, I do have a question here aimed at anyone with decent familiarity with both systems, which I will get to in a minute.

I used several different C64s a lot in school back in the day, and one C128. I was very young at the time, so I never really did much with them, but my school let me do whatever I wanted on them so long as I didn't screw with their disks (I remember playing around with "Logo Robot" for HOURS! Is there a version of this available for the Atari, or was it strictly a C64 thing?).

My introduction to computers was with an Atari 800 my dad had bought sometime in '80, so it was the machine I monkied around with more than anything. I learned BASIC & Assembly on it and never got too deep into C64. These days, I still have my Dad's old 800, and the 130XE he bought later on. Of the 2, I use the 130XE all the time.

I picked up a C128 in a garage sale a while back for almost nothing, and, to be perfectly honest, about the only thing I remembered how to do with it was kick it into C64 mode. Had my dad owned a Commodore machine instead of an Atari, I would probably be a Commodore user/collector. The C128 is still sitting in the closet gathering dust. Hasn't even been turned on since I bought it.

Anyways, I don't know much about all the different BASICs available for the C64 (a quick google search led me to a page with a SHITLOAD of different ones. wow.).

On to the question: So Simon's BASIC is supposedly fast as hell, eh? How does it compare to Turbo BASIC XL (my favorite flavor on the Atari)? Each have their respective compilers.

Now, just so nobody gets the wrong idea, I'm not trying to discredit either machine or Peter. I'm just asking a question.

Definitely. Actually, it was the first emulator that could handle
horizontal display manipulations. (-:

So long,
Thomas

The reason that so many BASICs were released is that the built-in BASIC sucked. (Yes, I'm a 100% C64 guy, but it's simply fact that CBM BASIC V2 is underpowered for the hardware and the disk drive speed is crippled. Everything else is automatically better than any non-C64 machine, though. ;)) So there was a supposed market for BASIC upgrades, but most decent programmers went straight to assembly instead of trying to boost the BASIC capabilities. BASIC had basically become regarded as for beginners and lamers, though it had some limited success in business/serious applications. In regards to your question, I don't think you're going to get much response about the various performance measures of upgraded C= BASICs because the most people who would care about such performance didn't use them. :)

Wel, ehhh, one thing I remember about Simon's BASIC was that it WASN'T fast
:).

I once wrote a line-drawing routine that was faster than Simon BASIC's. I
don't know why, I was just trying to make my own line-drawing routine in
assembly.

I remember having to replace the sid chips every two weeks or so, and also
having to re-align those 1541 drives almost every 3 days.

C64 was a real piece of shit.

Sounds a lot like you had a really bad power supply and/or serious
problems on your mains power. Though I assume you knew that the power
supply was a likely source of problems, since the C64 was famous for
flaky power supplies.

The hardware does it as standard in character mode; if the upper bit of the
colour nybble is set, the graphics are in 160x200 multicolour and if it's
not set they're in 320x200 hi-res and that mixing can happen on a per
character basis so it's far more flexible than a vertical split.
Essentially, the C64 is always "thinking" at 320x200 resolution regardless
of the mode, the horizontal smooth scroll and horizontal sprite positions
are always working at that res even when in multicolour graphics or sprite mode.

Mid-scanline changes can be done between multicolour and hi-res bitmap, i
did it in my demo Lethargy in 1993 (hi-res bitmap logo on the left with a
$D016 wave effect, multicolour bitmap with interlace on the right) and
there's a better example by Crest in Ice Cream Castle if memory serves.

I'm not sure how a 'color' can be 'blurry'. Maybe you've never seen an
Atari connected to a decent display using an Svideo cable...?

> In HiRes, the A8 can only use 2 colors.The C64 can use all 16. The

Well, we all know that Atari had really lame priorities ever since...
well... when did Bushnell leave? :)

<snip>
> The C64 did never have this compatibility issues. Programs worked
> on every C64.

Regarding DOSes, it's not hard to simply boot another DOS on the Atari,
since they're on disk. No ROM chips to swap out. :)

> And the C64 didn't have such a lame DOS. It has its disk operating
> system and it works.You don't have to search for the correct DOS,

People still use cassettes? :) Oh wait, you're talking about back
when the C=64 came out.

People still used cassettes in 1983!? :)

<snip>
> BUT, it forced us to learn POKEs and learning POKEs is
> the first step to learn Assembler, machine language.

I went straight from Atari BASIC to Action!, and then into C.
Thanks to Atari, Action! and C courses in college, I'm now employed
full-time as a video game developer.

I'm not sure how much 6502 experience would help. I haven't done _one lick_
of assembly in the years I've worked hear. It's practically shunned upon.

(These are phones with 100x the computing power of the Atari or C=64,
with threaded OSes and such!)

<snip>

You seemed to focus a lot on games. Of course, we all know that
IBM PC and Apple killed the Atari and Commodore both, simply because
so many more people wanted to do _non_game_ tasks.

<snip>
> This is the reason, the C64 dominated the 80s and the
> 8 Bit era. It was cheap, powerful and easy to
> understand while the ATARI was old-fashioned,

Don't tell that to me when I try to sit down and load a game on a C=64.
Sure, the Penny Arcade theme song is catchy, but my friends and I
had to ask the artist what the hell "L shift O to the quote and then dollah"
actually _meant_.

Jeez... anyone at Commodore ever hear of typing "DIR" [return] to get
a disk directory!?!? :)

The Atari 8-bit and the C64 had a lot of custom hardware in them. The Apple
II and the PC were built from parts-bin stuff. I played some Apple games on
a emulator out of curiosity, and I was not impressed with them, particularly
after playing the same games on the C64. The Apple's graphics were not much
better then CGA graphics. Nor was the sound anything worth noting. Remember
that the Apple used a mono-channel beeper just like the PC did. The
difference was that on a PC, the timer chip controlled the speaker. On the
Apple, the CPU controlled the speaker, so you couldn't have much of any
sound in games as it would slow down the whole computer.

> that is true, and yet there are some great games for Apple II series.

There were some good games for the CGA PCs, as well. Digger, Alley Cat, and
Shamus were some examples of well-done games on the PC.

This is what I think, based on remembering talking to many people who
were deciding what to get back then:

They NEEDED to get the cost down! Trouble is they never got it down
far enough fast enough to compete with the C64. The 800 was trying to
compete with the Apple2, but it couldn't due in large part to Apple's
wise maneuver of getting education all outfitted in Apple. By the
time Atari tried (and failed) to compete with the C64 price point, the
momentum was already in the C64 favor. I still remember Atari 800XLs
at $320 with C64s at like $200-250. It is my belief that the
technical merits of the machines was less a factor than price point.
I think the great unwashed masses, rightly or wrongly, saw them as
rough equivalent commodities and came down on the side of price. And
the C64 was cheaper.

>But anyway, you could have kept you post a lot shorter. The argument of the
>8 sprites is enough to make the C64 come out on top.

The 8 sprites is definitely the superior of the Atari, but for me, not
enough to put it on top.

>And the argument of the C64's BASIC is only partly true. Stick in a Simon's
>Basic cartridge, and the machine destroys any Basic ever run on any Atari.
>You can also load Simon's Basic from tape or floppy.

No, it doesn't. Atari8 wins the BASIC battle IMHO. BASIC XL/XE,
Turbo BASIC (and the compiler! yeah!) are the better. Simon's BASIC
was pretty darn good though, and light years ahead of the built in
BASIC. Also on a stock alone basis, Atari's BASIC was much better
than the C64 built in.

I might also add, that Atari wins in the OS/DOS department as well.
SpartaDOS (especially X) was way ahead, and stock for stock or modded
for modded, Atari's floppy drives were faster too.

I think both the C64 and Atari8 were/are fine machines and I have a
similar respect for both. And I'm not just saying that to try and
compromise.

Commodore had for more quality issues than Atari. Not that Atari was
saintly mind you (especially once the XEs came out). No one with a
shred of honesty even pretends to debate this.

Hi Bill!

Good descriptions all around. On the monitors I've owned (an old
Magnavox, long gone, and a Commodore 1702, still around) APAC mode
worked quite beautifully. On other peoples' monitors it looked rather
sick. I've always attributed it to the filtering methods to separate
the brightness (Luma) signal from the color (Chroma) signal on NTSC
monitors. Some displays used a notch/bandpass filter. "Better"
displays used a comb filter that involves a one-horizontal line delay.
See this link: http://www.extron.com/technology/archive.asp?id=ntscdb3

On an Atari 8-bit running APAC mode, this had the desirable effect of
bleeding the color (from the 16 hue line) into the next line of 16
greyscale (and probably the other way around for the next line).

Not that Im disagreeing, because Ive heard many horror stories of commodore equipment, but all I can say is Ive had almost zero problems with my gear over a period of 18 or so years.

Ive had one 1084S blow..... and one really old c64 I acquired recently blew a CIA.... and thats pretty much it. I have stacks of gear, and it all just seems to work....

I must be blessed or something.

is it just me or is this argument about as dated as a stick vs a rock

sure i still have my c64c in the garage i even did the x1541 cable and put a bunch of games off of the arnold ftp site back on disk but i grew out of it quite a while ago

i wont be playin with it untill someone gives me a device that will allow me to use a zip drive with it the loading time was always the joke

i was loading rambo 3 once and forgot what game i wanted to play before it loaded

to me the nes killed the c64

i did a bunch of school papers with bank street writer and used printshop to make banners and cards for birthday parties for years(i still have a reem of paper with the tractor feed werent those the days)

to be honest i bought a few games mostly from accolade and electronic arts and every time i bought an ocean game i sould swear it was my last but i must have bougt 5 or 6

the main reason i liked it was the ease of copying games and downloadin them on my 300 baud modem

which was the atari computer that had the keyboard that was a membrane i knew a guy with one of them and didnt buy an atari till the lynx came out

HAH! Even we Atari fanatics hate the keyboard on the 400 (personally, I hate the whole damn machine). The 800, however, has/had a great keyboard. Never had an XL, but the keyboards in the XE line suck. SUCK. SUCK. SUCK. The guys I telnet chat with are used to hearing me complain about how it feels like I'm typing in oatmeal with my 130XE.

Maybe one of these years I'll get the keyboard kit for it to make it feel less mushy. :)

Source record: 8295

I have here an excellent 1050 drive complete, boxed in excellent condition but it refuses to start. The mechanics seem as new but the PCB has had its day. I'm looking to buy an old 1050 that can be in any condition but must have a working PCB (the drive itself can be knackered, missing etc) so I can do a switcheroo. Even just the circuit board would do.

The only ones that turn up on ebay seem to be fully functioning, now is the chance for you to get a bit of money for an old drive carcass that just lies around.

Emails to dunxuk at aol.com, I'm in the UK. Thanks again everyone!

5230. Has anyone tried making a port of Pirates! to Atari?

One advantage I find of the Atari over the C64 is that the graphics were always much cleaner. I think Sid Mier's Pirates on the Atari 8-bit would be nice. The swordfighting duos would be the hardest part to pull off. For the ships in battle, I think two players combined for each ship would do for two colors (usually black with white sail) and two missiles combined could be used for the gunfire. It would have been nice, oh well :) I thought the Atari ST Pirates! was nicely done especially with a harddrive. The C64 Pirates was a pain with all the load times.

You're apparently unfortunare enough to have late, chinese 130XE. Keyboards in those really do suck. However, a bit earlier XE computers - I have one, bought it in 1988 - have different keyboards, so called "on springs", and typing on that is really very convenient.

Nothing beats the 800 in that matter, though.

this is true, back in the 80's I got a 130xe for Christmas when they
first came out and the keyboard was nice. It's long gone :-(but I
recently bought a 65xe (actually the same as a 130xe minus the extra
ram) it was one of the late model NTSC XE's and the keyboard is pretty
bad! It doesnt bother me, because to be quite honest Id ont do much
serious typing on it... but it is mushy!

HI,
Well, I have alot of game machines/classic computers and alot of carts for each of them, and when I play it is a pain. You know what I am talking about. I am looking for a way to fit as many into one cart as possible, so I can box up alot of my carts and put them in a safe place. I know of some that exist, but are there more, or maybe better solutions ?

Systems I am looking for:

Intellivision: Well, I know there is a thing like the Atari Supercharger exists, but now out of production I would love to play ECS games on the real deal :(

Colecovision/Adam: I found one, but Telegames pulled the plug on this multi-cart. I may just have to find a way to back them up on disk.

Atari 7800: Cuttle cart is the way to go. I wish these were on all systems :)

Atari 8-bit: FlashMax looks great

Commodore 64/128: So far disk looks like my best option. Somebody has suggested Retro-Replay. Would that work?

Oddyssey2: 128-in-one looks like the best option

Vic-20: Well, I wonder loading from disk onto 24k card would do the trick

Farichild Channel F: I think I am out of luck here

I have a large collection of classic units, and large collection of game carts for each one. I would like to box up alot of my carts and put them in storage to make some room around here. I was wondering if there are any solutions for these systems or better ones than I have found so far.

Commodore 64: Somebody recomended a Retro Replay, does this hold alot of rom images? If not, I'll have to research in running them off the floppy drive.

Vic-20: Found nothing so far, but would it work to have a 24k ram board and run carts off the disk drive?

Atari 8bit: I have a Flash Max!!

Atari 7800: Cuttle Cart2

Coleco: I know there was a multi cart, but Telegames shut it down. A flash cart would be nice but haven't found one. I could possibly run carts off the floppy on the Adam I guess. I would love to see a cuttle cart2 type thing for it.

Oddyssey2: I found a 128-in-1 cart!

Intellivision: All I found so far is a Supercharger type device which isn't made anymore. I want to play the ECS games on the real thing!! I would love to see a cuttle cart2 type device for it.

Fairchild Channel F: I think I am out of luck here LOL

5243. Multi-carts and Flash carts on classic systems

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-08 14:32:11 UTC
From: big_d_316@yahoo.com
Message-ID: <1136730731.012275.267890@g44g2000cwa.googlegroups.com>

I have a large collection of classic units, and large collection of game carts for each one. I would like to box up alot of my carts and put them in storage to make some room around here. I was wondering if there are any solutions for these systems or better ones than I have found so far.

Commodore 64: Somebody recomended a Retro Replay, does this hold alot of rom images? If not, I'll have to research in running them off the floppy drive.

Vic-20: Found nothing so far, but would it work to have a 24k ram board and run carts off the disk drive?

Atari 8bit: I have a Flash Max!!

Atari 7800: Cuttle Cart2

Coleco: I know there was a multi cart, but Telegames shut it down. A flash cart would be nice but haven't found one. I could possibly run carts off the floppy on the Adam I guess. I would love to see a cuttle cart2 type thing for it.

I don't know if this is rare or not, but I found myself in possession of this single sheet of paper that is a correction from Atari for the 410 Operator's Manual.

The only 410 Operator's Manual that I have right now is C014810 Rev. 2, and already has this identical information on the back page. So presumably this correction sheet was to be paired with Rev. 1 of the manual.

Anyway: http://home.centurytel.net/hunmanik/410insert-os255.htm

I had 9 C64's, 2 C128's and a bunch of drives at one stage and none of them
ever had a problem.

5248. USBDOS 0.1 - Tool to access FAT32 Filesystem on an USB Storage

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-08 21:43:28 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <pan.2006.01.08.21.43.28.37429@strotmann.de>
Source record: 8198

Hi,

A preview of a new tool to access a FAT32 Filesystem on USB Storage can be
downloaded at Sourceforge:
http://sourceforge.net/project/showfiles.php?group_id=111428&package_id=175280

Sourcecode and short Command Summary USBDOS Program is available in the
MicroUSB Wiki:
http://www.strotmann.de/twiki/bin/view/Microusb/ProjUSBCartUsbDos

The current version is not really useful for Users. It is more a preview
what will be available in the next weeks.

This tool will be expanded in the
next weeks and will hopfully evolve in a full DOS for USB FAT32 Devices.
It will be possible to copy File from USB Device to the Atari and back in
the next versions. This version can be used to explor the Device and to
list the Root Directory on an USB Storage.

Best regards

Carsten Strotmann
MicroUSB Project
for Atari XL/XE

I should have mentioned, I used it in the Carribean, tropical
climate...perhaps heat might have been an issue?

If the power supply was anywhere NEAR as bad as Grenada's in the 1980's, it could be a combination of heat and bad power supply from the grid. Luckily I had a C128 when I was in Greneda, and it had a much more robust power supply than the C64.

I don't get it. Sour grapes would be if you lose something and won't
admit that its your fault. I didn't work at Commodore either before
they lost the plot or after ... why would noticing that they lost the
plot be sour grapes?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Humid?

Not really compared to the tropics it's pretty dry.

(I'm in Perth too btw)

5261. Magnavox Computer Monitor 80

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-09 15:48:33 UTC
From: Jason Harmon <spam@sucks.com>
Message-ID: <xludnbs4ztBMGF_eRVn-pw@adelphia.com>
Source record: 8218

I have an excess Magnavox Computer Monitor 80 available to anyone who is willing to pay shipping for it.

This is a composite green screen monitor. Unlike some versions, this one has no sound input or speaker but has a very clear picture, and a clean non-yellowed case.

Note: Although I get a great picture in Atari graphics modes and from an Apple II in both 40 and 80 columns, it doesn't seem to want to sync when attached to my XEP-80. This also happens with my other Magnavox Computer Monitor 80, so I don't know if the problem is my XEP-80 or just that these monitors are incompatible with it.

Anyways, the first person who claims it and is willing to pay actual shipping costs gets it. Email me at jharmonNO@SPAMus.net (obviously removing NO SPAM from the email address).

5262. Incorrect information about Koronis Rift at wikipedia.org?

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-09 21:03:00 UTC
From: Anders Skelander <ansk@hotmail.com>
Message-ID: <8cAwf.153728$dP1.512117@newsc.telia.net>
Source record: 8219

Some threads posted recently in this newsgroup, and the
comp.sys.cbm newsgroup, made me want to check a couple of
games for the Atari and compare screenshots with the
Commodore 64 counterparts.

I happened to find an interesting record in wikipedia.org, about
the game in general, but also with a comment on the difference
between the Atari and Commodore versions.

http://en.wikipedia.org/wiki/Koronis_Rift

I am a bit surprised to read the third sentence in the first
paragraph. It must be a misunderstanding, that the Commodore
version utilises colour better, to fade in graphics.

Anders

I've put together a black t-shirt and mouse pad at CafePress sporting
the Star Raiders heads-up-display with a big "WHAT'S WRONG?" in the
corner. :^)

For folks who feel like wasting $20+ bucks on such a shirt
(some change is thrown my direction ;^)), see:

http://www.cafepress.com/xlfan

I hope to add some other Atari 8-bit related stuff, like a t-shirt
with a big READY prompt, at the least. ;^)

I remember returning to the island after years, when I got out the plane the humidity hit me as if I had just walked into a bathroom that someone just took a shower in. When I reached home, pretty late, downstairs was all locked up and as I was having dinner, I was drowning. The pepper sauce didn't help either.

Not according to the BBC Weather Bureau. They have the humidity below 60 percent for November to March, and it only gets to 76 in winter AM. Where I was born "humid" means closer to 100 percent than to 50 percent. Those are called "the dog days of August". That's the kind of humidity I felt in Grenada, but being on the Windward side of the island meant that it was OK if you were on a shaded patio on the sea breeze side. The BBC weather bureau has Kingston Jamaica (one of the few Caribbean cities it lists) as being close to that, with AM humidity ranging from 77 to 88 percent, and PM humidity ranging from 61 to 73.

Of course that's its not as bad as Houston ... AM humidity in the high eighties 12 months of the year. In the summer time its like living in boiling water.

SNIP
Also, as a side note Draco has a program called mksdfs.com that is similiar
to SpartaDOS format program and will set up a SDX file system on any
partition. The following text is his readme for the program. Just recently
got this one and have not tried it on the MyIDE interface yet.

MKSDFS - MaKe Sparta FileSystem

The program initializes floppy
disks and hard drive partitions
with fresh structure of Sparta
DOS filesystem.

This action has similar effect
as formatting: all files get
lost. However, no physical (hard)
formatting takes place.

In other words, the program
does less or more the same thing
as does the SpartaDOS X's FORMAT
command, when you select the
"Build directory" option.

I wrote this, however, because
I wasn't able to find any sensible
replacement working with
SpartaDOS 3.x. Also the primary
purpose of this program is to
initialize hard drive paritions
but it should work with any other
disk-type device.

Options:

-t is 'test mode', the program
does all the things it does normally
but it does not alter the filesystem.

-o is 'optimize filesystem' - the
last sector of the disk, normally
always marked used, is recovered.
Expect complaints from CleanUp,
however.

Have fun,
draco AT atari.org

Using fdisk.bas from MyIDE and make your partitions and try this program.
Using the swap partition function of MyIDE software.

That's a pretty amazing mod, since video generation is so
pervasive in the Apple II design.

How did it do that?

The VB3 consisted of two boards. One was a rather long slot card, and one was a big rectangular card that sat over the power supply. The two were connected by a ribbon cable. You pulled out about a dozen of the TTL chips in the Apple, and installed small ribbon jumpers between them and the VB3 boards. The slot card was mostly digital, and the card that sat over the power supply was mostly analog.

The main purpose of the VB3 was to act as a gen lock and proc amp, make the video fully compliant with the NTSC spec (and thus FCC broadcast requirements) and do simple video overlay and keying. The linear mapped hires graphics mode was a bonus; since they replaced the entire video timing chain anyhow, it was relatively easy to add.

Schematics weren't available, and I wasn't inclined to try to reverse-engineer it. I suspect that the most amazing part of the design was getting the color phase correct. One of the most serious deviations of the Apple II video from NTSC spec was that it used 228 cycles of the color carrier per scan line, rather than 227.5. Woz did that so that the color phase would be the same on all lines. But that doesn't work if you're generating true NTSC.

Eric

Thanks for the explanation.

Now that I know it's a genlock card, I understand both the motivation
and the niche market support for such a complex modification.

In 1979-1980, I lived in Austin, TX, and the local TV station used
a Apple equipped with a genlock card for the weather forecast graphics.

Sounds like it might have been this system. ;-)

I would think the C= version would be the worst because of it's
character cell problem. Atari has the most colors, so it should be the
best.

5281. Re: Riddle of 8-bit ASCII's

Newsgroup: comp.sys.atari.8bit

Source record: 8238

As a partial answer...Long before there were video displays, computers printed to electric typewriters...teletypes. A set of codes were developed to control the machines and send text, numbers, and punctuation. ASCII codes.

Codes 0-31 were machine control codes...still are.
32 is space, 33 and up is numbers, punctuation, uppercase and lower case.

Once you start working with video screens, in order to clear the screen which is a better value to poke into each location..0 to 32? 0 of course, so the ascii codes table got rearranged...and atascii was born...with the original 0-31 codes being augmented with displayable graphics characters, and values about 126 being inverse video.

And yes, some codes were changed to reflect their function on screen...155 being a cr+lf.

Keyboard codes are a special case related to the keyboard hardware matrix itself..it gets converted from a table in rom. On the XL/XE, you can create a soft table and make a dvorak keyboard.

I assume all computer manufacturers made changes to the codes to suit their needs.

Well, short notice, my apologies, I have been a bit tied up.

But if you are in Dallas and would like to make it to a mainly Atari 8-bit party, drop me an E-mail at goodwing (at) aafes (dot) com. I'll E-mail back directions and a way to contact me. Leave me a number in the united states, and I will call you after 9 pm tonight or even tomorrow.
If you can't make it, we will call you from the party.

You can also party in the Atari chat room at telnet://www.atarinews.org.
Chat room starts at 7 pm CST, party in Dallas (with Pizza served on a floppy) :) will start at 8 pm cst.

Bring your 8-bit and a way to connect to the ethernet (and maybe a ethernet cable) and we'll let you jack in and talk in the chat room. So everyone in the world will be able to party tomorrow night. It's just that I'm spotting for the pizza for those that attend. :)

See ya'll tomorrow,

Doc Clu

5287. Modded 130XE

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-12 20:37:09 UTC
From: Docrotcod <rahbart@cox.net>
Message-ID: <g6zxf.42922$QW2.20907@dukeread08>
Source record: 8241

I'm sure this is nothing new, but wanted to share what i've done with my 130XE.

Basically all I did was install the internal MyIDE. But instead of using the standard 2.5" Notebook HD I installed a IDE/CF adapter. I hot glued it down on top of the PIA chip. Pulled power from the capacitor between the CPU and SIO port. The thing works like a champ! I highly recommend this as a solution for anyone wanting to use the MyIDE.

One other thing: In the internal MyIDE specs it says to use the 1.5Amp power supply in order to power the hard drive. Using this CF adapter the power draw is low enough it seems the 1.0Amp power supply is doing just fine.

Source record: 8245

One of my 800XL's is messed up. When I turn it on I get an orange screen (that sometimes changes to yellow). No boot noises... no hesitation just Power ON -> Orange.

Anyone ever seen this or have any ideas what it might be?

>Pascal or Turbo Pascal for the Atari 8-bits?

From what I remember of Pascal, it's fairly similiar to C, isn't it?
Perhaps it could be ported to C fairly easily?

There exists a good cross C compiler for the 8-bit at http://www.cc65.org/

There was someone who posted a picture of thiers, where they have the CF
accessible from the side of the case (a slot was cut in the case to allow
access just above the joystick ports.)

Check out http://www.atarimax.com/flashcart/forum/ for news about the
latest developments for MyIDE.

Personally, I'm doing all development on the 3.5F and 4.x versions.

My CF card and adapter is coming! Just ordered one off eBay.

Check the power supply (swap out for a known good one) and/or RAM (might
have to desolder.) Often you can just put your finger on all the RAM chips
in order and see if there is one that is much hotter than the rest... that
is likely the bad one.

After that, I would start checking the custom chips (ANTIC, GTIA, CPU).

5295. USB Video Capture for A8?

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-13 13:16:10 UTC
From: Larry <LLppwhite@aol.com>
Message-ID: <1137158170.661724.138340@f14g2000cwb.googlegroups.com>
Source record: 8152

Is anyone using a USB2 video capture unit as the display device for their Atari? I have used an ATI All-In-Wonder card for several years, but I'm considering going to USB2 for my next PC, if USB does a good job. -Larry

5296. ABBUC software contest 2006...

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-13 14:16:57 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <43C7B659.E8111516@students.uni-mainz.de>
Source record: 8153

Hello folks,
ABBUC decided to do another software contest 2006. There is only one
change to the rules of 2005 - the deadline has been set to the 15th of
august (same deadline as hardware contest 2006)...

ABBUC
Regeln für den ABBUC-Software-Wettbewerb 2006
Rules for the ABBUC-Software-Contest 2006
Pravidla pro ABBUC-Software-Contest 2006
Zasady ABBUC-Software-Contest 2006
Reglamento del concurso de software ABBUC 2006

Regeln für den ABBUC-Software-Wettbewerb 2006:
1) Allgemeine Regeln:

Der Abgabeschluß für den Software-Wettbewerb wurde auf den 31. August
2006 festgelegt.
Folgende Preise werden vom ABBUC vergeben: 1. Platz: 500 Euro
2. Platz: 250 Euro
3. Platz: 125 Euro
4. Platz: 75 Euro
5. Platz: 50 Euro
Der ABBUC erhält für die angemeldeten Programme das
Erstveröffentlichungsrecht für das Magazin bzw. den Software-Wettbewerb;
das Copyright bleibt jedoch weiterhin beim Autor, der sein Programm nach
dem Wettbewerb frei verwenden kann. Die Präsentation der Programme wird
auf der Unconventional und im ABBUC Magazin stattfinden, die endgültige
Entscheidung und Preisvergabe hingegen auf der ABBUC-JHV in Herten im
Oktober. Der Autor muß bei beiden Veranstaltungen (Präsentation,
Preisvergabe) nicht unbedingt anwesend sein, er erhält den Preis dann
trotzdem zugesandt oder überwiesen, sofern dem ABBUC dafür die
Postadresse und/oder Bankverbindung vorliegt...

2) Programm Typen und Größe:

Bei den Wettbewerbs-Programmen darf es sich um folgende Programmtypen
handeln:
a) Spiel/e, b) Anwendung/en (auch Tools, Utilities, etc.) und c)
Betriebs-Systeme (DOS). Nicht erlaubt sind jegliche Formen von Demos
oder Intros, sowie Beta-, Vorab-, oder Pre-Versionen (die Programme
müssen fertiggestellt sein). Bei der Kompatibilität ist zu beachten, daß
die Programme mind. auf einem XL oder XE Rechner laufen müssen, d.h. auf
einem Standard 64k oder 128k Atari XL/XE. Es darf zwar Zusatzhardware
unterstützt werden, diese darf aber nicht die Voraussetzung zum Laden

oder Laufen des Programmes sein. Und ob man es nun glaubt oder nicht, das ABBUC Software Ressort (und auch alle ABBUC Mitglieder) wird (werden) einen ☐Qualitäts☐ und ☐Kompatibilitäts☐ Check aller angemeldeten Wettbewerbs-Programme durchführen...

3) Format und Sprachen:

Das Wettbewerbs-Programm kann auf 5,25☐ Atari-Disk(s) oder als ATR-Image(s) eingereicht werden, es muß als 90k (SD) oder 130k (ED) Disk-Format bzw. ATR-Image vorliegen. Zu dem Programm muß eine kurze Anleitung vorliegen, diese kann entweder im Programm (intern) enthalten sein oder als Text-Datei (extern) dazugefügt werden. Wichtig ist hierbei, daß entweder Deutsch oder Englisch verwendet wird (und kurz erklärt wird wie das Programm zu laden ist), damit auch jeder das Programm bedienen kann. Es sind übrigens alle Atari 8Bit kompatiblen Programmiersprachen erlaubt, jedoch am Ende nur Kompilate, damit jeder das Programm laden kann. Ausnahmen sind lediglich Atari Basic und Turbo Basic XL - hier sind auch Sources bzw. Listings erlaubt, da diese Sprachen ja jeder Atarianer besitzt. Zu den Programmen bzw. Kompilaten muß keinerlei Sourcecode beiliegen, das fertige bzw. lauffähige Programm ist schon ausreichend...

Also dann, viel Spaß beim Programmieren - euer ABBUC Software Ressort.
(Charlie Chaplin / Andreas Magenheimer) Mail

Rules for the ABBUC-Software-Contest 2006:
1) General Rules:

The Deadline for the software-contest has been set to 31.August 2006 (until midnight).
ABBUC will therefore spend the following Prices: 1st Place: 500 Euro
2nd Place: 250 Euro
3rd Place: 125 Euro
4th Place: 75 Euro
5th Place: 50 Euro
For all registered contest programs, ABBUC will get the right of a premiere-release on its magazine; the Copyright will still remain by the author, who can use his program freely after the contest. The presentation of the programs will take place at the Unconventional fair in September and on the ABBUC magazines, whereas the decision and pricing will take place at the annual ABBUC meeting in October. There is no need for the author to be present at any of these events, the price will still be send to the author☐s postal adress or his bank account, provided that ABBUC has these adresses...

2) Program Types & Size:

The software-contest programs must be one of the following program-types:
a) Game/s, b) Application/s (also Tools, Utilities, etc.) and c)

Operating Systems (DOS).
Not allowed are any kinds of demos or intros, also not allowed are any beta- or pre-versions (meaning the contest programs must be finished). For compatibility reasons one must make sure, that the programs work at least on Atari XL or XE computers, which means standard 64k or 128k machines. Additional or extra hardware can be supported, but it must not be a requirement to own this extra hardware to load the program. Believe it or not, the ABBUC Software Ressort, as well as all ABBUC members, will do a □Quality□ and □Compatibility□ check of all registered contest programs...

3) Format and Languages:

The software-contest programs can be send as 5,25□ Atari disk(s) or as ATR-image(s), but they must use Single (90k) or Enhanced (130k) density. Furthermore, the program must have a short documentation, this can be included in the program (internally) or as a separate text-file (externally). It is therefore important, that one uses german or at least english language (and explains shortly how the program has to be loaded), so that everyone can handle the program. All Atari 8Bit compatible languages are allowed as programming languages, but all of them have to be compiled in the end, so that one can load the program without having to own a certain programming language. The only exceptions here are Atari Basic and Turbo Basic XL source listings, since every Atari user owns these languages. Lastly one needn□t supply any source-codes for the contest programs, the finished loadable or executable program is enough...

Happy programming wishes the ABBUC Software Ressort !!
(CharlieChaplin / Andreas Magenheimer) Mail

Pravidla pro ABBUC-Software-Contest 2006:
1) Hlavní pravidla:

Uzáverka soute□e je 31.srpna 2006 (o pulnoci).
ABBUC bude udelovat následující odmeny: 1.místo: 500 Euro
2.místo: 250 Euro
3.místo: 125 Euro
4.místo: 75 Euro
5.místo: 50 Euro
U v□ech programu registrovaných v této soute□i si ABBUC vyhrazuje právo premiérového zverejnení v magazínu Abbuc. Autorská práva zustávají autorum, kterí mohou s programem nakládat libovolne po ukoncení soute□e. Prezentace programu probehne na akci Unconventional (bude se konat v zárí) a v magazínech Abbuc. Vyhlá□ení výsledku a pridelení cen se uskutecní na výrocním setkání Abbuc v ríjnu. Není nutné, aby autori soute□ních programu byli osobne prítomni na kterékoliv ze zmínených akcí □ odmeny budou poslány na jejich adresy nebo bankovní úcty, které sdelí organizátorum.

2) Typy programu a jejich velikosti:

Programy prihlá□ené do soute□e musí být nekterého z následujících typu:
a) Hra, b) Aplikacní program (nástroj, utilita, atd.) nebo c) Operacní
systém (DOS).
Nejsou povoleny jakékoliv druhy demonstracních programu nebo inter,
jako□to ani □ádné betaverze nebo nedokoncené ukázkové verze programu □
programy musí být ve finální verzi.
Z duvodu kompatibility je nutné, aby program fungoval na standardních
pocítacích Atari XL nebo XE (velikost pameti 64KB nebo 128KB typu Atari
130XE). Roz□irující úpravy pocítace mohou být podporovány, ale nesmí být
povinne vy□adovány aby program be□el. Proverení kvality a kompatibility
v□ech soute□ních príspevku bude provádet ABBUC Software Ressort a
v□ichni clenové ABBUCu.

3) Formát a programovací jazyky:

Programy do soute□e mohou být posílány na 5,25□ Atari disketách nebo
jako ATR-soubory, ale musí být v Single (90KB) nebo Enhanced (130KB)
hustote. Krom toho je vy□adována strucná dokumentace, která mu□e být
obsa□ena budto prímo v programu, nebo jako samostatný textový soubor. Je
dule□ité pou□ít Nemecký nebo aspon Anglický jazyk a v krátkosti
vysvetlit jak se program spou□tí a ovládá.
Program mu□e být napsán v jakémkoliv Atari 8bit kompatibilním
programovacím jazyce, ale nakonec musí být zkompilován tak, aby □el
spustit bez nutnosti mít k dispozici cokoli dal□ího. Jedinou výjimkou je
povolení programu vy□adujících Atari Basic nebo Turbo Basic XL, nebot ty
jsou pou□ívány v□emi u□ivateli.
Není treba dodávat jakékoliv zdrojové kódy soute□ních programu □ zcela
stací jen spustitelný soubor.

Príjemné programování vám preje ABBUC Software Ressort !!
(CharlieChaplin / Andreas Magenheimer) Mail

Zasady ABBUC-Software-Contest 2006:
1) Zasady generalne:

Ostateczny termin skladania prac do konkursu zostal ustalony na dzien 31
sierpnia 2006 (do pólnocy). ABBUC zapewnia nastepujace nagrody:

1sze miejsce: 500 euro.

2gie miejsce: 250 euro.

3cie miejsce: 125 euro.

4te miejsce: 75 euro.

5te miejsce: 50 euro.

ABBUC bedzie mial prawo do publikacji programów zgloszonych do konkursu
w wydawanym przez siebie magazynie; prawa autorskie pozostaja wlasnoscia
autorów, którzy moga dowolnie dysponowac swoim dzielem po zakonczeniu

konkursu. Prezentacja prac bedzie miala miejsce na imprezie Unconventional we wrzesniu, oraz w magazynach ABBUCa, zas decyzje i rozdanie nagród beda mialy miejsce podczas dorocznego spotkania ABBUCa w pazdzierniku. Autorzy prac nie musza byc obecni na zadnej z tych imprez, nagroda bedzie

wyslana zwyciezcom poczta lub na konto bankowe, zakladajac, ze ABBUC bedzie posiadal te dane...

2) Typy i Rozmiary Programów:

Programy zgloszone na konkurs musza nalezec do jednej z kategorii:

a) Gra, b) Aplikacja (równiez: Program Uzytkowy, Narzedziowy itp.) lub c) System Operacyjny (DOS). Wszelkiego rodzaju dema/intra nie sa dozwolone, nie sa dopuszczalne równiez wszelkiego rodzaju wersje pre- i beta

(program wystawiany do konkursu musi byc ukonczony). Dla zachowania kompatybilnosci program musi sie uruchamiac przynajmniej na komputerach Atari XL lub XE, co znaczy: na standardowych maszynach z 64 lub 128 KB pamieci. Rozszerzenia sprzetowe i sprzet dodatkowy moze byc obslugiwany, ale nie moze byc warunkiem uruchomienia programu. Wierzcie, lub nie,

ale ABBUC Software Ressort, jak równiez czlonkowie ABBUCa sprawdza "jakosc" oraz "kompatybilnosc" wszystkich zgloszonych prac...

3) Formaty i Jezyki:

Programy zglaszane na konkurs moga byc wysylane jako dyskietki 5,25" lub pliki ATR, ale dopuszczalne sa tylko gestosci pojedyncza i rozszerzona. Co wiecej, praca musi posiadac krótka dokumentacje, która moze byc umieszczona w samym programie, lub w dolaczonym pliku tekstowym. Ponadto istotne

jest uzycie jezyka niemieckiego (lub w ostatecznosci przynajmniej angielskiego), oraz krótkie objasnienie sposobu uruchamiania programu, zeby kazdy mógl sobie poradzic z obsluga. Dopuszczone sa wszystkie kompatybilne z Atari jezyki programowania, ale produkt ostateczny musi byc skompilowany,

aby mozna bylo program uruchomic nie posiadajac tego jezyka programowania. Jedynym wyjatkiem sa programy napisane w Atari Basicu oraz Turbo Basicu XL, które to posiada kazdy uzytkownik Atari. Dolaczenie kodu zródlowego programu nie jest wymagane, wersja skompilowana i uruchamialna jest wystarczajaca...

Milego programowania zyczy ABBUC Software Ressort !!

(CharlieChaplin / Andreas Magenheimer) Mail

Reglamento del concurso de software ABBUC 2006
Reglas Generales:

El plazo final de entrega es el 31 de agosto de 2006 a la medianoche.

ABBUC entregará los siguientes premios:

Primer Lugar: 500 euros.

Segundo Lugar: 250 euros.

Tercer Lugar: 125 euros.

Cuarto Lugar: 75 euros.

Quinto Lugar: 50 euros.

Para todos los programas concursantes, ABBUC tendrá el derecho de
publicarlo en su revista; los derechos seguirán con el autor, quien
podrá usar su programa libremente después del concurso.

La presentación de los programas tendrá lugar en la Feria
No-Convencional de Septiembre y en las revistas ABBUC, donde la elección
y premiación se realizará en la reunión anual ABBUC de Octubre.

No hay necesidad que el autor esté presente en alguno de dichos eventos,
ya que el premio puede ser enviado a la dirección postal del autor o
bien a su cuenta de banco, siempre y cuando ABBUC tenga los datos
correspondientes

Tipos de programa & tamaño:
Los programas del concurso pueden ser de alguno de los siguientes tipos:

Juego/s,
Aplicación/es (como Herramientas, Utilitarios, etc.) y
Sistemas Operativos (DOS)
No se permite ningún tipo de demos o intros, así como ninguna versión
beta o preview (lo que significa que dichos programas serán
descalificados).

Por razones de compatibilidad, el autor debe asegurarse que su programa
funcionará en al menos en un computador Atari XL o XE, lo que significa
máquinas estándar de 64 ó 128 kilobytes. Hardware adicional o extra
puede ser utilizado, pero no debe ser un requerimiento poseer dicho
hardware extra para que el programa funcione. Créanlo o no, pero tanto
el organizador del evento como los miembros de ABBUC realizarán pruebas
de "Calidad" y "Compatibilidad" para todos los programas concursantes

Formato y lenguajes:
Los programas concursantes pueden ser enviados ya sea en disco(s) de 5¼
como en imagen(es) ATR, pero deben usar densidad SIMPLE (90k) o
Aumentada (130k). Es más, el programa debe llevar una pequeña
documentación, la cual puede ser incluida en el programa (internamente)
o como una archivo de texto separado (externamente). Es importante que
dicho texto se encuentre en alemán o al menos en inglés (y que explique
brevemente cómo el programa debe ser cargado), de manera que cualquiera
pueda utilizar el programa.

Todo lenguaje de programación compatible con Atari 8bit está permitido, pero todos deben ser finalmente compilados, de modo que se pueda cargar el programa sin que se necesite poseer cierto lenguaje de programación en particular. Las únicas excepciones aquí son los listados programados en Atari Basic o Turbo Basic XL, dado que cualquier usuario Atari posee dichos lenguajes.

Finalmente, no es necesario que nos envíen los códigos fuente de los programas en concurso, basta con se envíe el ejecutable final.

¡Mucha suerte en su programación! Les desea el equipo ABBUC.

(CharlieChaplin / Andreas Magenheimer)

I suggest either Win APE or DOS APE, depending on which type of OS you want
to run. If you're not interested in the internet modem (like me), DOS with
APE on an old laptop works great! See Steven's site at www.atarimax.com
for ordering details.

> http://www.slornet.com
I suggest APE also, probably the DOS one. It is 'crippleware', some
features are
disabled in the trial version. However, your stated desired use is fully
supported
in the trial version. If I recall, APE DOS allows all PC to A8 functions,
it just doesn't
allow copying from A8 to PC. There are other 'disabilities', all explained
in the
documentation. Yes, I suggest APE for DOS or Windows.

Then again, you could actually purchase it. :) I did, and it has been
worth every penny - plus Steven gives excellent support.

And, of course, if you've got Linux in the house (like I do), and don't
Windows (like I don't), "atarisio" and "atariserver" are excellent!

Bob Woolley did that to one of his 1200XLs. CF card slot on the right,
cart/joystick ports on the left.

...and even if you are not a Linux guru (like I'm not) and don't like
Linux yet (raise your hands) you can still use AtariSIO.

If you are are real nice Matthias Reichl may supply you with a floppy
image which you can 1) produce a bootable floppy 2) Make an Eltorito
bootable CD from the image or 3) do 1 or 2 and then copy the files to a
DOS environment from which you can simply launch mini Linux, customized
for AtariSIO or 4) use a utility like WinImage (I think that's the
name) to extract the files directly from .IMG file to a FAT partition.
Yes, you have to boot DOS to launch mini Linux.

Anyway, I love AtariSIO and I'm still not a Linux user. (I keep
trying, honest I do).

800XL works but but 3.5 mods out of 5 don't.

1) Clear picture mod still has weird leading edge colors but picture is very sharp.

2) Internal SIO2PC works great. I love modular RJ11 cable, light weight, long lengths possible, and doesn't fall out (unlike those darn SIO connectors).

Finally bought off-the-shelf RJ11/DB-9 female adapters $1.89 each (something like that). Now I can plug the RJ11 cable into any of my PCs not just the one.

LOL spent about half an hour trying to figure out the pinouts I used. RJ11 is butt end to butt end. It's straight thru but pins 1-4 become 4-1 at the other end so remembering Send/Receive, ground, and Command line in the Atari connect to which solder joints on the RJ11 connector, connects to which pins inside the moudlar connector, maps to what pins at the other end, maps what RS232 pins. Well, that was all an ordeal. I never write things down.

I should have built a Max233 interface (like my external one). The 1-chip 14C89 SIO2PC works but I forgot it's not compatible with my ATR8000 (dumb mistake). Further I can't even connect the external Max233 interface and use that to talk to the ATR8000. Well, I don't use it much and I still have the 800.

I did find it amusing that I can use both the internal SIO2PC and the external one and talk two different PCs. Can't say I have a practical reason to do this.

3) I botched the Wizztronics 256K upgrade. I've got one of the 800XL models that requires two extra ICs for the Wizztronics. Problem was

all the mounting holes on the Wizztronics board were filled with solder. I tried to remove it without the proper tools and did a poor job. Put the chips in anyway but they were only half in. Needless to say the board doesn't work.

4). Homebrew MyIDE still doesn't work yet. Originally it would properly detect only 1 drive out of the 4 spares I have but that drive had 20+ errors so I couldn't really use it. Mr Atari suggested I replace the 74HCT ICs with 74F types but now I have 33% errors on that drive and MyIDE gets random data for Cylinder/Head/Sector information. The old partitions (and new ones) are still there but I can't access them.

Right now I'm wondering if a CompactFlash is more tolerant of the timing problems.

4) Bob Woolley's SmartOS is going equally badly. I should never have stuck with the original plan and not try to scale it down since I don't read schematics very well as it is.

First I planned to piggback the SRAM over OS ROM but I was waiting for a friend to burn some backup EPROMs for me. He was busy so I scaled the project back to doing just the internal cartridge. I put a 28 pin socket in the stock 24 pin socket and pulled A12 from elsewhere. (A12 on the stock socket sits where EPROMs/SRAM have CE/CS. Must have done something wrong. 800XL jumped into memory test and the last 1/6th of memory failed. I reworked the NAND gate ICs and simplified the project even further by trying to just create the $D700 page of memory (It's part of Bob Woolley's complete project). Unlike the -BASIC select line which gets controlled by the OS (cart/no cart) the -$D700 is always available. I thought it would make troubleshooting easier.

I finally got RAM to appear at $D700 but I must have the gates wrong. When I write 256 bytes of information to that page about 5 bytes are wrong. On successive reads the data starts to change.

Frankly, this is probably no project for a Noob like me but I'll keep working at it.

At least I'm learning, though it seems the more I learn the more I realize I don't understand what I'm really doing. LOL!

My 800XL is now a nest of wires

At least I haven't destroyed the 800XL. Yet!

Im getting that impression. I have 2 old pc's which are perfect one
is a pentium desktop (with win95, cdrom, floppy) the other is an old
IBM thinkpad with only a floppy drive. I want to eventually just use
the laptop because it is not noisy with fan and doesnt take up any
space, but since my main pc does not have a floppy I will need to
transfer software via cdrom to the desktop then use it to sneaker net
the software to the laptop.

Im thinking it is prob better to just use the dos version since it
will load so much faster?

APX (Atari Program Exchange) released a version of Pascal for the Atari,
however there were apparently some issues with it. This article I Googled
seems to spell out some of the issues with it. The high memory usage of the
runtime would almost certainly be an issue with a BBS program.

http://www.cyberroach.com/analog/an11/pascal.htm

The author mentioned "Turbo Pascal". The only Turbo Pascal I have ever
heard of was the wildly popular Borland Turbo Pascal developed originally
for CP/M, and then MS-DOS. It eventually evolved into Borland Delphi. It
certainly was never ported to the Atari.

If this could be ported to the Atari, perhaps Action!, C, or even BASIC XE
would be the best targets.

I would like to thank everyone who made the chat party last night such a blast. We had Docrotcod, Davidb, myself, and Rick D on speakerphone here at the Dallas area chatting away with our computers setup (An Atari XE, 800, and a Mac lap with Atari fonts at least)

In the chat room we were welcomed by Slor, eventually followed Cybernoid, Mojo, and Dan. Chatted till about 3 in the morning. :)

Thanks for the most fun we've had in a while. We've have to meet like that we think sometime in March. Sounds good to me. :)

5315. Atari Age contest - JOUST!

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-14 10:38:28 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <002dc5c5@familynet-international.org>
Source record: 8177

FamilyNet International Newsgate

As I was telling Docrot last night at the party, Atari Age has restarted their gaming contests for another year. The first game was Zybex, the second game, JOUST!

http://www.atariage.com/forums/index.php?showforum=60

While there are no details posted yet on how they are conducting the Joust contest, I sure before this weekend is over they will post it. If you haven't joined these contests, now is a great reason to start because...

1) This is a brand new year
2) Games played in contests two years ago tended to soak up the all time favs like Joust, which are now available to be voted on, thus meaning more familiar titles to play.
3) I have had a lot of fun learning about other games aside from my Star Raiders, Archon, Wizard of Wor and Joust that I have played for umm... decades. :) (and I once swept a contest on a game I had never played before. So you never know.)

(If you have any questions, or need help finding a game image, let me know.)

So for now... let the JOUST begin!! (lowers visor on helm.)

Three or four other 800xl's all work fine on that power supply so I don't
think that is it. All the chips in this machine are socketed, so I will
start with the RAM.

Thanks

There are:

Atari Pascal
Draper Pascal
Kyan Pascal
CLSN Pascal

The first three are readily located with XL Search,
http://www.newbreedsoftware.com/xlsearch/ .

I just noticed that, rather strangely, there seems to be no mention of CLSN
Pascal on the web at all! It was more recent than the others, a commercial
release that required a 128K XL/XE. Who owns a copy?

YES? I DO. It runs on XLIT on a Win98 machine using DOS 2.5. I have the documentation
at another location, but it is fairly intuitive, with sample programs on the distribution disk.
I don't know why it will run on XLIT, as I think XLIT is strictly 64K. What I have at this location
is a .arc of a .dcm, and dcm->atr and run in XLIT. Should be in someone's archive, It's not in
Holme's, or CTH. Maybe one of the Polish or Chezchk (sp) or German. Seems like I'd be willing
to put it in someone's archive. Oh, there's the Vietnamese archive, but I think that is mostly games.
I hardly used it, and don't remember any specifics/idiosynchracies.

Hi Kevin-
> I want to eventually just use
the laptop because it is not noisy with fan and doesnt take up any
space, but since my main pc does not have a floppy I will need to
transfer software via cdrom to the desktop then use it to sneaker net
the software to the laptop.

Im thinking it is prob better to just use the dos version since it
will load so much faster? <

If I understand you correctly, you want to use a laptop that has no
hard drive as your vehicle/server for your Atari via the SIO2PC cable?
And you want to use the ATR image software on CD-Rom on your Atari. If
this is correct, then no HD will certainly limit your options. APE for
Dos is very functional, but can't compare to the ease of use of the APE
for Windows interface. Fortunately, trial versions of both are
available, so you can try before you buy and see how things work out.
Good luck. -Larry

Ive been sick all week with a fever, so maybe I came across a bit
confusing! You see I have 3 computers. One I am using now which is
a new modern pc. In the other room where I am going to set up up the
65xe/sio I have 2 old pc's one is a desktop (circa '96) with
win95/HD/CD/Floppy and the other is a really old thinkpad laptop a
relative gave me instead of throwing it away.

I want to use the Laptop with the Atari, but in order to get software
to it (since my modern pc down not use a floppy) I need to copy the
8bit stuff to the old pc and then slowly use the floppy drive to copy
over stuff to the laptop.

....

My main reason for using the dos version is it will load faster (takes
forever to load windows) is there some great advantage to using the
Windows version of APE?

5326. Happy 1050 with any normal DOSes?

Newsgroup: comp.sys.atari.8bit

Here's the setup I have:

1200XL with APE Warp+ OS
1050 with newest Happy Enchancement

My question is - is the high-speed mode of the Happy upgrade compatible with any normal DOS like MyDOS, SpartaDOS, or some modifed DOS 2.5? The Warp DOS that comes with the upgrade is pretty limited...

Alternatively, is there a way to make Happy upgrade compatible with US doubler?

Thanks!

There is an OS patch that will load the Happy Warp Speed drivers into the
OS. I believe this is on side B of the Happy diskette. You just set it as your
autorun.ar0 or autorun.sys file and Happy drives will work at high speed after that.

On the Happy utility menu of the Warp Speed software disk, there is an option
to enable US Doubler emulation. That will change the drive to US Doubler mode
until you power cycle the drive.

I am pretty amazed at the MyIDE idea, the continuing developments in Atari mods continues to surprise me. Does anyone know of plans to enable a hard disk to be attached via the serial port SIO2PC-style, rather than through the cartridge contacts? It would be great to be able to attach a drive directly without going through a PC or the cartridge slot.

you would need a intelligent controller to comm with the
8bit/harddrive. I would think it would be too much work/expense to do
this.

a few questions dely (since I cant make head or tails out of that
website) This costs how much? ~30$ translates into what American
dollars? Also how does this work? is there an external version that
doesnt require any soldering? Am I right in assuming you are
formatting the HD on the pc and then removing it and installing it in
the XE? Finally how does this compare speedwise with a Harddrive
attached thru ECI port?

Thanks

Assembled unit costs about 100PLN (Polish Zloty), 1 USD (US Dollar) =
3.15 PLN.

> Also how does this work?

It is emulating up to 9 Atari drives (D1: to D9:) via ATR files located
at FAT formatted HDD.

> is there an external version that
> doesnt require any soldering?

Yes, you can plug it into SIO hole ;)

> Am I right in assuming you are
> formatting the HD on the pc and then removing it and installing it in

Yes. It is also equipped with USB for easy uploading ATR's without
removing HDD.

> Finally how does this compare speedwise with a Harddrive
> attached thru ECI port?

Poor, max is Ultraspeed (56000 bod).

dely

Project Badsector.

I started this project in 2000 and wrote what would now be called a blog.
I wanted to interface an IDE HDD using the SIO so that it would work with my
old Atari 800. I built a prototype and got it working. The web pages are well
out of date as I have now had a PCB manufactured. The project stalled when it
came to the Atari DOS software part of the project. It can currently emulate a
floppy drive which shows that all the hardware is working.

For more information including schematics and source code goto:-

http://www.alma.demon.co.uk/Atari/AtariHwSw.html

I've also worked on other projects based on the same hardware, such as
interfacing a ISA ethernet card to the same project. In theory this would
allow the Atari to speak via the SIO to ethernet, although I'm not sure what
use this is.

If I get time I ought to update the web pages and add some more pictures.

regards...

--Gary

However, the driver may or may not work with dos 2.x, but you can give it a
try if you just name the file autorun.sys

The main problem with this concept is the data rate. The SIO port is serial, while the MyIDE basically goes through the PBI/ECI interface. While you MIGHT be able to accomplish hooking a IDE hard drive via the SIO port, it would defeat the purpose as it would be way too slow to transfer data of any respectable size.

Thomas

I don't know about that. From what I've heard, the SIO2IDE project is
pretty good. After all, a large part of a person's hard drive activities,
even on a MyIDE is loading basic disk images (games, demos, etc...) and
these were meant to load from floppy anyway, and thus through SIO.

The nice thing (AFAIK) about the SIO2IDE hardware is that you don't need
special drivers or OS patches.

Still, I don't have one, and have two MyIDE interface and have written
three (and a half) programs for the MyIDE interface.

On that topic, I'm batting around the idea of creating a simple sector
editor for the MyIDE hardware. Anyone interested in a program that can
look into and edit the raw hard drive sector data on a MyIDE setup?

Yes..

I would also like a way to format a partition other than 16mb when using SpartaDOS. Maybe one where you could tell it how many sectors you were formatting and it would do it.

> My main reason for using the dos version is it will load faster (takes forever to load windows) is there some great advantage to using the Windows version of APE? <

It depends... To me, the "point-and-click" ease of Win APE far outweighs any loading issues. Win 95/98 loads very fast, and Win APE is fully functional with W95 or W98. Naturally the more stuff that loads at start-up, the longer it takes. I sometimes use Win APE with a small, older Pentium 266 Mhz laptop, and W98 boots on it in about 45 seconds. So, to me 45 seconds is not an issue. I've used registered versions of both Dos and Win APE, and to me there is no comparison. But that's just my opinion.

But I still wonder how you can use a laptop with no hard drive for APE at all. You can do that with SIO2PC, but even the Dos version of APE requires a HD, according to the manual. Perhaps you have figured out a way to do this.

the laptop has a harddrive, what would be the point of using a
computer with SIO/2PC without one? It just does not have a cdrom
drive, and so I need to use floppy disks to copy all the .atr files
over.

If you have Win95 (or better) on the laptop get a null modem cable and transfer the files using Direct Connect to the laptops HD from the other PC. Will take awhile but much faster than the floppy. If you only have Dos, try using interlnk, Intersrv to do the same in dos mode. This is how I installed Win95 on a laptop with no CD and a bad floppy (dos interlnk / intersrv). Took all night to transfer the files at a maximum of 9600 baud but it worked.

Last week I ordered a MyIDE from ATARIMAX, and plan to use a 32MB Compact Flash card on my little ol 800XL. I am used of useing DOS 2.5 on my trusty 1050 on the Atari, but have grown to love Windows XP on the PC. Please no flames about XP ;)
Anyways I been reading up on differant GUI's and DOS's. So far I think a GUI would be nice to have, and have thought about ATOS, Diamond GOS 3, and Contiki, as far as DOS I am narrowed to Sparta, and Mydos.

What I would like to do, is set up subdirectories, and have one be for Atari Basic, Turbo Basic XL, Machine language. I would like a setup that would load most machine language programs on the market, and APX games and whatnot, and load and run Basic, and maybe even Turbo Basic programs.

BTW are there and IDE/CF adaptors abailable that can plug into the PBI slot?

I had a null modem cable a million years ago, but I have no idea where
it is now. Today I went to 2 Radio Shacks looking for a 5pin DIN so I
could make a monitor cable for my Atari with no luck! I couldnt
imagine finding a null modem anymore.

They still make / sell them - May be called a PC - PC direct connect
cable. If you have an old laptop you may want a serial one though
instead of the parallel (unless your parallel port can do
bi-directional).

Radio shack still carries the 25 pin null modem adaptor:

http://www.radioshack.com/product/index.jsp?productId=2103637&cp=&kw=null+modem&parentPage
=search

You would need that, along with 2 db9 female to db25 male cables and a
db25 gender changer. I use this setup here and then use Hyperterminal
in Windows XP & 95 to transfer files back and forth to the old laptop
at 115kbaud - works pretty good.

Or - you can just make your own. Get a 6ft db9 - db9 serial cable, cut
off insulation (without cutting wires) and then using a voltmeter to
deternine which wire is which, then just cut and rewire as in this
diagram:

http://www.lammertbies.nl/comm/info/RS-232_null_modem.html#full

Or - 3rd option, if you have a pcmi slot in the laptop, get a pcmi
network card and network the 2 machines (if you have a network card on
the other).

Or 4th option - if you have USB on the laptop - get one of the usb
thumbdrives and transfer the files to it / then to the laptop

Out of curiosity, did you get a ROM chip with your MyIDE, or were you
going to run it off the cartridge?

I'm currently doing the latter (so it swaps Atari OS ROM out of the way
and uses RAM-under-ROM for the MyIDE stuff), and therefore I can NOT run
TurboBASIC XL (or any other XL-only software, including many games and demos).

I believe if you simply get the OS ROM, that allows many more things to run.
(Of course, not _everything_. Some things still require the original OS ROM,
since they were coded in a not-so-proper fashion ;^))

Source record: 8116

Ok, on XL/XE machines, I believe we can ? PEEK(98) in BASIC, zero means we have a NTSC GTIA, 1 means a PAL GTIA. Correct?

How is the equivalent done on the 400/800? It looks like location 53268 (decimal) is supposed to do it, but I don't seem to understand the results. Memory map sources mention values of 0 for PAL, or 13 or 14 for NTSC, but when I PEEK(53268) I get 1 or 15, respectively. What am I doing wrong?

Doubler mode
until you power cycle the drive. <

Hmm... I never knew that you could just take the Warp Speed Dos module
(Autorun.sys) and use it with other Dos types. Live and learn.

The Happy docs are somewhat vague about exactly what you get with Ultra
Speed Emulation (other than *slightly* faster speed). I'm not a
frequent Sparta user, but even with US emulation set, I've still never
been able to format a disk with Ultra Skew under Sparta X. Has anyone
been able to do this? However there are some other utilities that
allow doing that. -Larry

Exactly, Bill.

You can't run TurboBasic XL or SpartaDos. With the eprom MyIDE OS you can
run SpartaDOS and probably TB XL (never tried myself.) Here's where I plug
Steve Tucker's 32-in-1 OS upgrade (http://www.atarimax.com/). Gives you
the MyIDE OS plus a bunch of other OS, some very useful, some just sort of
goofy but cool to check out once in a blue moon (Arabic OS!)

Also should have mentioned... this doesn't affect a lot of people, but a Happy drive has somewhat limited functionality with a Black Box. For instance, if running a BB with the XL/XE OS, the Happy will produce an occasional error 139. And if you run the diagnostic while in the XL/XE mode with the BB attached, it will fail the diagnostic. If you use an 800-type OS in Rom, it will pass the diagnostics. And SOT, when programming a flash cart with the BB attached, it will produce an error just about 100% of the time (at least mine does). -Larry

Will start off with basic interfacing mods (printers, mice, light pens, etc.) and will gradually move up to video projects and power supply projects that will require a bit more "finesse."

Thanks for asking!

A decent design of a parallel harddrive interface for Atari does not require
"special drivers or OS patches", either.

Michael Current:

> Ok, on XL/XE machines, I believe we can ? PEEK(98) in BASIC, zero means we
> have a NTSC GTIA, 1 means a PAL GTIA. Correct?
> How is the equivalent done on the 400/800?

I think (altough I don't own 400/800) it is done the same way,
cause it's OS job to set that memory cell based on GTIA
register $D014

> It looks like location 53268

that one ;) where bits 1-3=0 or 1 depending on what system is it.

> Memory map sources mention values of 0 for PAL, or 13 or 14 for
> NTSC,

Yes 0 or 14, but after AND #$0E (must clear bit 0).
1 and 14=0 , 15 and 14=14
.
> I PEEK(53268) I get 1 or 15, respectively. What am I doing wrong?

Treat that value as OS does - and #$0E, then zero or nonzero.
Best that way, cause I am not sure if always ALL bits 1-3
are 1 on ALL machines, but it's sure that all of them are 0.
OS is checking that way (below).
So after AND it may be 0 or 2,4,6,8,10,12,14 ;)

```
LDA $D014
AND #$0E
BNE NONZERO
LDA #$05
LDX #$01
LDY #$28
BNE ZERO
NONZERO LDA #$06
LDX #$00
LDY #$30
ZERO STA $02DA
STX $62 - and here you see OS is setting cell at 96 to peek.
STY $02D9
```

If 400/800 OS is not doing it then you just have to do it yourself.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Rewiring a USB dance pad to work with the atari joystick port is really easy, I did it a while back to make a floor controller for my kids and just wrote a simple program to play a musical note when they stepped on the pads so they could stomp around and make horrible music.

It is a really easy interface job, for programming, just assume the 8 directions on the joystick, or four if you want to keep it simple.

Unless you have the older Happy Rom, it is already built-in compatible
with the US. Doubler. And you get Warp/Ultra speed with any DOS (or
software) that supports those speeds.

If you have the older Rom, then you have to enable U.S.D. emulation with
the happy software. Boot the happy software, select Drive options, and you
should see an option (Enable U.S. EMU, or something like that).

The Happy doesnt support the 'f' command for formatting with custom skew.
You dont need this at all with the Happy. As long as it is in fast mode,
the happy drive will read at exactly the same speed any disk disregarding
the skew. So there is no reason to use that option unless you want to use
the disk with a drive enhanced with the USD.

Run the diagnostic program in the Happy software rev. 7. It might work with older version, I dont know for sure. But just in case use 7.0 or 7.1. Select the option to test RAM and ROM, I think its called Enhancement diagnostic or something like that.

After the ROM test, there is a word that shows all in uppercase if you have the newer ROM, or capitalized if you have the older one. I dont remember if the word is ROM (Rom), PASS (Pass), or TEST (Test). But this is described in the rev. 7 software manual. I will look it up if you dont have it.

As a last resort just try using an older Sparta Dos version without enable U.S. emulation. If you get the Ultra speed, then you know you have the newer ROM. Note that newer versions of Sparta, like Sparta DosX have a driver specific for the Happy that enables U.S. emulation. So you must use Sparta 1 or 2 for this test. And make sure you power-cycled the drive before the test, otherwise your drive might have been already programmed with the U.S. emulation

5378. XEP-80 Monitor at Walmart

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-18 15:42:37 UTC
From: jdplace@REMOVESPAMcableone.net
Message-ID: <11ssofdh4sevhcf@corp.supernews.com>

In case anyone is looking for a monitor for their XEP-80, I discovered that Walmart sells an inexpensive security monitor and camera for about $45.00 that will display all the characters. It's a black and white 5.5" monitor, so it's on the small side, but it was exactly what I was looking for because I have a very small work space, mostly because I'm using a 19" LCD for a color monitor for my 130XE :-)

5.5 inches? Yikes!

I've been using a 9" security monitor off and on since the early 1980's
with my 800. It's great for 40 columns but I can't imagine using it
for the XEP-80's 80 columns.

[off topic]
OK, I take that back. Three days ago my 2nd PC's CRT died so I plugged
this old B&W (composite video) into the S-Video out (with a homebrew
adapter for luminence) of my video card. So I guess I am using it in 80
columns, now. LOL! It's sharp but this is like looking at 8 pt type.
I still can't imagine using 5.5" display but thanks for the
information on where to get one.

I too am curious about what you are using to connect your Atari to a
19" LCD.

I'm using an outboard TV tuner (obsolete Viewsonic VB50HRTV) with my
19" CRT. This turner has RF, composite, and S-Video (my 800XL feeds
this) but only VGA output. I haven't seen anything similar with a DVI
output so I was just wondering how you are connecting the LCD.

I JUST ended up buying a PlayStation->USB adapter for my Linux box
(for both the DDR dance pad, for which I'll try out PyDance, as well as
for simply playing with PlayStation joypad controllers).

Also, someone just emailed me this:

http://www.kraftbrands.com/activegame/pad.aspx?e=email

I'd be interested to hear about getting USB working with the Atari joystick
port. (Or did you actually cut the lines inside the dance pad, to make
it act as an Atari joystick, rather than as a USB device???)

Just released new versions of MyIDE Config, MyIDE Image Manager and a new program called MyIDE Image Batcher that lets you copy multiple ATR disk images to image space in one batch process.

These versions only work with the newer 3.5F and 4.x versions of the MyIDE OS.

Check them out here:
http://www.jeffersonsauctioneering.com/atari/

If you find the programs useful, let me know! If you have any suggestions for features and enhancements or bug reports, send me a message!

I bought a gender bender, a DB 9 > 25 adaptor, and a null modem cable today.
I was trying to cut down on the massive wad of adaptors I use to connect the
modem Greg Goodwin loaned me to my 850. Thanks again, Greg! I hope to get a
UDS10 or MSS100 next month. :)

Anyways, if you happen to have one near you, I suggest you go to a Fry's
store. Be warned: every Fry's store I have ever been in is very neat and
organized, except when it comes to cables, adaptors, and occasionally
components... I dug thru a clusterfuck for over an hour before I found what
I was looking for, but it was there.

Why is it that everyone wants a 1200xl? I had one when they came out -
brought it at a bargain basement price since no one wanted it then due
to the incompatibilities with the 400/800/600xl/800xl?

On the other hand - I actually liked it alot. I would plug in the basic
cart from an 800 Ihad and never had a problem with incompatibilities.

I'm not extremely versed on this - can you give a brief summary or point to
a URL on the incompatibilities that exist?

thanks

The main incompatibility was the 16k rom versus the 10k in the 400/800,
though there was a translator disk that let you solve that. It has been
awhile since I last used an atari outside of an emulator (or the 2600)
so I don't remember them all. I recall in Mapping the Atari there was a
number of things that they said were different on the 1200xl versus the
others. This site details a number of the rom differences:
http://www.atariarchives.org/mmm/appendix_eleven.php

This site shows the differences in the Parallel Bus interface on the
1200xl:
http://www.retrobits.net/atari/pbi.shtml

I'm using a Paradise video box similar to what you are using. No
DVI, just VGA out. FYI O/T I use the same box/monitor for monochrome

for my 1040STe with a VGA converter for ST on the VGA input.

Only good reason to get a *stock* one is they come with a good keyboard.
I have an 800, 130XE, 800XL, and I prefer the 1200xl keyboard.

The incompatibility was a pirate and phoney marketing thing. Some of the
early hacks like CARTCOPY had an illegal jump to the OS. The real carts
would work just fine but the dozens of pirated pieces of software would
crash on a 1200XL. IIRC a lot of that copy stuff came from Gardner
Computing and it was his habit at the time to make that illegal call.
For that matter the same hacked software would crash on a 800XL too. I
think if you look at the software that legitimate users call
incompatible you will find it is a much shorter list.

That is also why "The FIXXL" worked/was written. It just loaded the 800
OS into an XL then prompted the user ~"Insert disk and press return".
That was because all the cart images were on disk.

The 1200XL is a hackers dream, they are fully socketed. None of that
desodering RAM to add a memory expansion like Rambo. Something goes out,
just plug in a new chip. If you have ever tried to trouble shoot an
800XL where one of the 40 pin chips went out, you really learn to love
the 1200XL.

There is a lot of real estate under the hood. The 1200XL uses just a
chip or two more then an 800XL but has a huge footprint. Bob Wooley even
pulled the 5V power supply<and RF modulator?> from his to make room for

his mods.

Bob's mods are a major reason to use a 1200XL. He has done everything from upgrade the video to built in BASIC to internal IDE drive. Some of it is kind of esoteric, like the OS comes in two 8k ROM and has provisions for either 24 pin or 28 pin devices: Makes it easy to put in multiple OS by substituting 27128's then adding a few jumpers and a switch.

Better than the 800? I'll be interested to see that then.

I was fortunate enough to have a socketed 800XL, but I certainly lost
any desire to mod my 130XE after I opened it up and found 0 sockets.

Yeah, I had figured that much out - it's a nice size mahine for cramming
stuff into.

I didn't realize there's not built-in BASIC in the 1200XL. What's there
instead, if anything?

Personally, I've thought it'd be cool to get a Serial Port CF card for
my Sharp Zaurus (they're ARM-CPU-based PDAs running Linux 2.4 kernel)
and try buidling AtariSIO and AtariServer for it.

Earlier this week, I saw a presentation from a fellow from JK Microcontrollers
in Davis, CA who are about to launch some 4" x 4" microcontroller units
that are also ARM-based and run Linux.

Get a little mutli-gigabyte CF micro hard disk, some batteries or
a power supply[*] to power it, and an SIO2PC cable, and you SHOULD be
set.

One day I'll play. :^)

[*] Interestingly, JK Micro's devices (their earlier ones are MSDOS-based
embedded systems in similar form-factors) appear to be powered by old
Atari computer 5V power supplies. :^) I forgot to take a photo of
that. Here are photos from the LUG meeting (you'll see me in one!)
where you can see the Linux microcontroller.

http://www.lugod.org/photos/2006.01.16/

It'll apparently cost ya $150-200 at Qty 1, though!

That's one of the reasons I'm trying to revise this info in the FAQ in such a
way that it's clear why this situation would happen.

Any software check for PAL or NTSC would technically be sensing whether it's a
PAL or NTSC GTIA that's present. My understanding is that there's no
difference detectable in software between a PAL ANTIC and a NTSC ANTIC.

Someone please chime in if this in incorrect!

-Michael

It is just a prototyping board and is not cpu dependant. I am not sure what connector is used for the Z80's but if the board can be plugged in then it can be used.

Isn't there a cartridge out there for the "ATARI SERIES" computers (400,800,1200, 130, etc.) that has a basic eprom in it and that allows you to run utils on it through the built in parallel bus i/o? I saw it a few times in CLEVELAND, OHIO on Ebay!

> Someone please chime in if this in incorrect!

Well, there's no single register in ANTIC that tells you whether you're
running PAL or NTSC, that's about right. However, there's still the
chance to find out, namely to check the maximal value of the YPos
(vertical beam position) register. For PAL, it runs up to 155 (312 lines
in PAL), for NTSC it only reaches 130 (262 lines for NTSC). Thus, in principle,
also ANTIC tells, though the procedure is a bit more cumbersome.

So long,
Thomas

So ? Finally it's GTIA producing display anyway, setting colors etc.,
so checking what system it works in is proper. Bad is only the way
program reacts :) cause never should tell that you cannot run it.

In XL/XE computers there is no PAL or NTSC OS ROM. Both versions have the same
OS. It is about the time to already know that, Bill.

Source record: 8075

I put an embedded computer in an old Nintendo. It's slow (233mhz) and really designed for Win CE, but I put XP and a bunch of emulators on there. I have Nintendo and Sega emulators, but what I really wanted to play are my old Atari games. I have images of most of the games I had and I downloaded a copy of Atari800Win Plus.

The problem is that every time I load a cartridge image, all I see is the Atari logo on the screen for the respective system that the cartridge is for. How do I get past this to play the actual game? I'm very confused. I also got a copy of Stella for the 2600 games. It's much easier to use, but too slow for this processor.

Source record: 8079

Hi,

> Can someone explain what the difference is between these? The best
> info I've found on the internet is that OE is faster, but takes more
> power.

That's about it. OE only drives the power of the output stage of the chip. If it is disabled, but CE is enabled, the performs the decoding of the input address, looks up the contents and places it on its output buffer. But because the output buffer is not enabled, the data does not appear at the data pins. With CE low, the full chip is inactive.

For the rather low frequencies within the Atari, it shouldn't make any noticable difference whether you use OE or CE.

So long,
Thomas

Atari certainly didn't lack when it came to investing in R&D. If anything,
they invested too much into it, b/c most of the things R&D created were
never used.

Me too. The 130 is a nice machine, maybe the best video output and
better functionality then any of the stock machines. I've even heard
some people like the feel of the keyboard.

<snip>
> I didn't realize there's not built-in BASIC in the 1200XL. What's there
> instead, if anything?
>

Nothing. A stock one just goes to an Atari logo with scrolling
colors/attract mode if no cartridge is inserted.

At one time I had what was apparently a prototype: The attract mode
listed maybe a dozen people that were on the development team. In a
confused momment I converted it to an OMNIMON OS and lost track of the
original ROMs.

5425. Problems with SIO2PC cable (need help)

Newsgroup: comp.sys.atari.8bit

From: kevin <kevnospam242@gmail.com>
Message-ID: <eve2t15bkaktgo6884qioa3v5ingotov9k@4ax.com>
Source record: 8082

I finally recieved the cable in the mail today. I decided to go with WINAPE (the trial version) to test it out. I ran into problems immediately, I have one serial port (com 1) and the WINAPE says "it cannot find a cable attached to this computer" altho it is attached. There arent any directions how do I get this thing to work? I am all set with the 65xe next to my pc and a nearby television, but still can't play Zybex!! Winape does say "Com 1 detected" at the bottom of the screen once it loads up, so it must be a config problem right?

BTW I know the com port works properly because I have an old Palm PDA which syncs to this computer via the same serial port.

any help would be appreciated.

My system is a pentium 4 running Windows XP if that helps.

thanks
Kevin

Which style of wiring does your cable use? There are two different options
for one of the connections, and you can set that option within APE. My
first suggestion would be to find that option and switch it to the other
setting (RI vs DSR).

Try Options>Ape Configurations then try different values for Serial
Control. Ring Indicate is the default. The other options are DSR and
CTS. Basic SIO2PC cables usually only have one line wired.

Oops, clicked Post Message too soon.

Regard the reference to "Design 6". Just a guess, but that probably
means Pin 6 of the DB-9 connector, meaning DSR is used for Atari
Command.

Is your Palm PDA software running in the background? It could be
interfering with the other program when it tries to talk to the com
port.

I was waiting for someone to ask this as soon as I mentioned it, no it
isn't. Im gonna give this another go tonight. Im dying to get this
working.

Ive tried all three settings. Im not sure Im doing this right. I
have the 65xe off, I select Spartados utility disk for disk 1 then I
turn the 65xe on and nothing... Am I doing something else wrong?
Niether CTS, RI, or DSR seem's to have any effect. All I get is the
rasberry sound the Atari makes as if nothing is attached???

I see. Guess I was hoping that there was a similar product for DVI :)

Do LCD panels do a decent job with A8 artifacting? Just curious.

Well poop. It sounds like you have done things correctly. Those cables
have been known to go bad in surges and such. You said this cable was old?
Or just the design is old? At any rate, I would drop Steven a line and ask
how you might go about testing.

Heh, sorry. :) I couldn't remember if it was in GTIA or OS ROM, and
I'm too lazy/tired/busy/not-caring-enough to double-check. ;)

Besides, I don't check that bit, since I write everything for NTSC,
so they should run well enough on PAL. ;)

Try re-runing the Auto configuration wizzard in the Options section.
However, if you are not seeing any Atari commands in the diagnostic
window of APE then I'm afraid Steven Tucker is the guy you want to talk
to. He is the author of APE.

Sorry, I couldn't be much more help. I haven't used APE since I
started using AtariSIO.

Way back when I had cable troubles, with a homebrew SIO2PC, I
downloaded the latest version of SIO2PC 4.1x something or other along
with some good utiltities for diagnosing communciation problems. Not
sure it will fix anything for you but it might show whether your SIO2PC
cable is valid.

Unfortunately SIO2PC is a pure DOS program. It kind of, sort of, works
from Win98 but I doubt it will from XP. You also have the problem of
how do get the diagnostic sender program onto the Atari if your SIO2PC
cable isn't working.

That's about all the ideas I have for what it's worth.

At one point I was compiling a list of games that use artifacting but I
lost it.

>From memory, QS Reversi and Diamond Mine use artifacting for 100% of
their colors. If you use an S-Video cable when playing these games all
you get is black and white video. Use a composite connection or TV and
you'll see the colors (or at least you are supposed to).

Wizard and the Princess does 75% of it's color with artifacting.

Choplifter about 33%.

I can't seem to remember any others.

Try one of the first two games and Wizard and the Princess, the latter
because the game has an artifacting test at the beginning.

Did you run the APE Configuration Wizard? I presume it is included in the trial version. That should help diagnose your issues.
Look under the OPTIONS tab of Win APE. BTW, where did you get your cable -- the guy in Poland (who makes very good cables)?

Some other potential issues: what type of cable -- one chip or two chip? What IC is used: 1489 (family) or Max 232(family)? Do you have any other drives, etc. on the SIo daisy chain?

Tower Toppler uses artifacting and i might be wrong, but didnt Drol
use artifacting as well?

Kevin (and Shawn),

Thanks,

Those games are news to me for using artifacting, except David's
Mdnight Magic.

I'm starting a new list. Hopefully I won't lose it this time. LOL!

I wanted a list because there's no artifacting when using a S-Video
connection and artifacting in Atari800Win Plus looks bad.

There's probably a huge number of games that use artifacting but the
ones that look black and white under the above conditions really stand
out.

5455. Another SIO2PC question?"?

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-21 21:34:34 UTC
From: kevin <kevnospam242@gmail.com>
Message-ID: <fq95t1lnubil0soalbfceud2tjd5g49a9p@4ax.com>
Source record: 7962

I recently purchased a SIO2PC cable from Ebay. I could not get it to work using any possible config with WINAPE, so I contacted the seller. According to him I need to have a floppy drive and DOS (an Ataridos) loaded for it to work and that getting an Atari to boot with the SIO is "tricky" he then sent me an email saying that I dont have the proper equipment to use this (since I donot have a floppy drive) and that I could send it back so that he could sell it to someone who "know's Atari" and that I should have an "Atari" partition on the PC anyway. He also said he used it with a 130xe/floppy drive combo without any problems (this is like 10 years or more ago according to him).

Is there any basis for what he is saying? I am familiar witht he 8bit been using them since the 70's but this is my first experience with the SIO2PC.

Any advise is appreciated.

No. All you should need is the Atari computer and a PC with a normal
serial port. Booting off the PC is actually simpler than some setup with a disk
drive and DOS already loaded.

I don't know what kind of SIO2PC cable you have, but if you drop me
an e-mail at classics@atarimax.com I'll be happy to help you debug the
problem. :D

Since the main purpose of this interface is to replace the floppy, that
sounds like a load. I have a cable that I use with APE, and all you need
is a bootable image in the first slot to be good to go. Unless there is a
miscommunication, I'd say the seller is likely confused about how things
have progressed in recent years with the availability of disk images.

According to an article in ANTIC, there is a simple mod that will allow a 1200XL to support the P:R: Connection. This mod is supposed to be detailed in the manual for the device. Does anyone have a manual I could get a copy from or know where it is already documented on the web?

thanks

I don't know what it is exactly, but I have a sneaky suspicion that all you
have to do is add the +5v onto the SIO port that the 1200XL lacks.

Adding a breadboard to that (instead of the solder pads) would make it
more appealing to a larger group id imagine. (though im partial to
xilinx :))

it would of been nice if Atari did some upgrades to the 8bit series over the years. Like for instance the AMY sound chip, and maybe even an 8bit with a faster CPU like the c128/Apple IIgs or somewhat advanced graphics while still remaining compatible with classic 8bits. Would of been nice, but never happened. Look's like we might get something like this in the FlashBack 3, but I would of been alot more psyched in 1986 then I am in 2005 for an advanced 8bit platform...

I recently read that IBM considered using the atari 8bit tech in the original IBM PC, now wouldnt that have been something? We would still in some way be using an Atari now!! Somewhere in our pc's we would have Atari 800 compatibility! the entire 80's and 90's would of been different because the PC would of built upon the 8bit architecture instead of the XT, then again, maybe it would of been a complete failure and we'd all be using Apple compatibles or some other platfom now!

There is still something about the my XE that is cool despite the fact my computer next to it is roughly 10 billion times better in every way, it is the Atari that I get excited about...

I'll be ordering the MyIDE + 1MB MaxFlash cart (as well as an 8MB
MaxFlash) in the next few days. I plan to use it with a CF adapter.
I have the 32-in-1 OS installed in my 130XE. It has versions 3.1e and
3.1i of the MyIDE ROM. How can I upgrade to the 3.5F and 4?

I had another quetion. Would it be possible to use the warp SIO
routines from Steve Tucker's Ape Warp OS in your MyIDE ROM? I have
gotten spoiled with the speed boost, especially since I got my entire
(original) floppy collection backed up and in ATR format now. I was
amazed that out of 193 disks totalling 24.2MB, I had less than a dozen
read errors from the floppies.

Speaking of breadboard vs solder pads, I just purchased a Microport XL
board. It is an experimenter's board that plugs into the PCI of the
800XL. It has a 6520/6830 PIA onboard, and a prototyping area. Since
I would like to make more than one project with it, I was planning on
soldering in wire-wrap pins to the prototyping area. I'll post some
pics when I get it all assembled (I didn't know I was odering a bare
board. I still have to get the parts to populate the board and then
assemble it.

Cool. I assume the resistor removal is allowing the +5 to get to the SIO
port?

Thanks to both of you!

Joseph D. Place <jdplace@removespamcableone.net> wrote:
> Can you give me an example of artifacting so I can test?

You can simply type the following program into Atari BASIC and RUN it :^)

```
10 GRAPHICS 8
20 SETCOLOR 2,0,0
30 COLOR 1
40 FOR X=0 TO 319 STEP 3
50 PLOT X,0
60 DRAWTO X,191
70 NEXT X
```

If you get alternating colors, it's artifacting.
If every vertical line is the same color (white/greyish), then there are no color artifacts.

Hope that helps!

stephensheppard@hotmail.com wrote:
> I wanted a list because there's no artifacting when using a S-Video
> connection and artifacting in Atari800Win Plus looks bad.

Ditto for regular Atari800 under Linux. The biggest problem I've seen
is that the artifact colors are always the same brightness.

So if you turn on artifacting, then do SETCOLOR 1,0,0, you'll still see the
edges of lots of the characters. :^/

I believe the artifacted pixels are always the same color, regardless of
the background color. (e.g., SETCOLOR 2,8,0 (blue) or SETCOLOR 2,0,0 (black),
the edge pixels are the same.)

I should dig around the artifacting code in Atari800 some day.
I doubt I'll make it anywhere close to "perfect", but hopefully much better
than it is now.

For now, I imagine it's "good enough" for most situations (e.g., many games).

5476. Archon Remake - Beta Released

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-22 13:40:26 UTC
From: Reppy <replicant2001@yahoo.com>
Message-ID: <1137937226.152496.155430@z14g2000cwz.googlegroups.com>

I don't know if any of you have been following the remake of Archon (my
all time fave 8-bit game), but a beta has (finally) been released!

See http://www.archonevolution.com for more information.

I downloaded it yesterday and my brother and I have played it loads
already. We think they've capture the feel of the original perfectly,
although it needs a bit of polishing (in the next build I think).
Hopefully I'll get to play a few of you using the network game option
(2P only in this build)...

Reppy
(I am in no way affiliated with this release - I'm just a huge fan)

Hi Greg-
Just out of curiosity, does WinAPE run ok under "Soft Windows?"
Presume that the Power PC cpu has enough "oomph" to run it. (?)
Although IIRC, some Mac's don't have serial ports, so that would
require some type of solution, also.

I just wish I could tone down the artifacting in Atari800Win Plus.

Don't know if this is true with Atari800 but in Atari800Win Plus the
GTIA color scheme for artifacting seems to be wrong compared to my
800XL. The CTIA colors are a closer match. I also find the general
colors are off. I need to set the Color Shift parameter equal to 55 to
get the hues close to my 800 and 800XL, though I leave the saturation
high, much higher than the real machines.

Emulator video is sharper with more vivid color but I still prefer
gaming on the real thing, Not sure why.

The ROM is Mr.Atari's creation, but yes, you can get high speed sio with
both the flashcart version and the eprom version. There is some discussion
on the Atarimax forums about using some loadable highspeed drivers and
we've been told that Steve Tucker has granted Mr. Atari the right to use
his high speed routines in the MyIDE OS (provided there is room for them.)

I thought I'd ask the qustion this time. Is there any reason to leave the RF shield in a machine that will never be used for RF video output? I have removed shields in the past as I've upgraded video and other components, and I was curious if there is ANY other value to the shield besides protecting the TV signal.

thanks!

I don't want to remove the device, just the shield. What I'm not sure
about is if there are any other circuits susceptible to the same
interference it is there to protect.

AFAIK the RF shield is to restrict emissions from the computer, not the other way around. It's to protect nearby TVs and radios from interference.

Most people have cable TV but if you happen to live in an appartment then an unshielded computer might cause big problems for your neighbors.

Even with cable TV I noticed that my unshielded 800XL throws off enough noise to affect channels 2 thru 6 from anywhere in the same room. My unmodified 800 doesn't do that.

You could get Steve to help you. I'd suggest getting your money back, since
the seller is willing to do it, and buying one of Atarimax(Steve Tucker)
interface. The Atarimax interface is a SIO2PC/APE and a PRO interface.
Steve may have one for sale on ebaY.
(I have no connection to Atarimax, other than being a satisfied customer.)

Perhaps I'll do a little testing around the house then.

I may have to remove/alter the shield anyway if I decide to stick a hard
drive in. This is a 1200XL, by the way - in case that makes any
difference.

I used to play a game on the Atari 600xl. It was a tape based game when you had a number of connected boxes that you moved around and when you had moved along all 4 sides of the box it would fill with color. The object was to get all the boxes filled and move to the next level. While trying to fill the boxes you would be chased by enemies (they looked like sparks). It is not Qix where you had to draw closed boxes, it already had the boxes drawn on the screen. Anyone have an idea what it was called? And even better if it is available online anywhere?

changing for the sake of change is not a good thing and that is the
way of giant software companies. updating is quite another story. sure
updates would be welcome and I am all for that. I should have been
more specific and not said pc but more just referenced that
monopolistic company that loves to change and break things. the pc
hardware has had great backward compatability thru the years and I
still use some of my 8 bit ISA cards in a machine with PCI slots and 1
ISA slot. amazing they did that.enough for now.

Here is my guess:

An incredibly addictive computer game with simple but atmospheric
graphics. The game you are looking for is "Drelbs", by Synapse
Software.

http://www.atari.online.pl/v01/index.phtml?ct=katalog&sub=D&tg=Drelbs#Drelbs

This sounds a lot like Drelbs, but I thought Drelbs is an OS 'A or B' game
and not for the XLXE.

Yes, you can run TBXL with the ROM OS. I got the MyIDE kit Friday and
stuffed it in my 130XE (god, desoldering my CPU and OS SUCKED), and that was
one of the first things I did, give TBXL a whirl. Works great. You can run
it straight off a partition instead of having to copy it to the image space.

Just downloaded Kid Grid - it was very similar to that - but the
graphics were better and the boxes bigger. I looked at Drelbs - that is
not it.

I know this disagrees with some of your other observations, but when you
say the enemies looked like sparks, I come to think of another game made
by Synapse Software - "Rainbow Walker".

This C64 screenshot (follow the link) has one of the enemies on screen.

That's good news that artifacting works on your LCD!

Are you happy with the Viewsonic NextVision N4? I have mixed feelings
about the obsolete Viewsonic VB50HRTV.

Ever since you brought up the subject of a black and white monitor I've
again been thinking about doing the old monchrome mod for the 800XL.
I've got an old PC monochrome (amber) monitor (MDA) that hasn't be used
for two decades. (I can't seem to throw anything away! LOL)

800XL to MDA only needs a couple of IC's. Doesn't look too bad.

The XEP80 to MDA mod looks even easier, no ICs. Of course, who still
owns an old MDA monitor (besides me, LOL).

5506. Looking for an Action! utility

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-23 20:05:34 UTC
From: stephensheppard@hotmail.com
Message-ID: <1138046734.672129.237880@g14g2000cwa.googlegroups.com>
Source record: 8013

I'm looking for a utility that provided a list of the procedures that are actually used when one compiles an Action! program using the OSS Runtime library. The utility made it possible to abbreviate the runtime library and use only the routines that your program requires, saving memory in gobs.

I don't remember the name of the utility or where it could be found orginally. I want to say it was a type in program from some magazine. I'm not even sure it really existed. Could just be wishful thinking on my part.

Does anyone recall such a utility for Action?

- Steve Sheppard

> Does anyone recall such a utility for Action?

Yep! Doing an XL Search search for "action runtime", sorted by Matches,
I found this:

"Here is Jeff Reister's PD Runtime package for the Action! 8 bit language."
http://www.umich.edu/~archive/atari/8bit/Languages/Action/actrun.arc

And this appears to be a straight ACT file, in ATASCII:

ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RUNTIME.ACT

Good luck!

Thanks Bill, but the those are both alternatives to OSS's runtime
library SYS.ACT.

What I am looking for is a symbolic reference tool, if you will. This
tool lists which runtime routines are referenced by your own program.
With that knowledge you can shorten the runtime source and thus shorten
your own compiled code.

Oh! Duh! I didn't read closely enough, obviously. Sorry! :^)

Over at the CTH mirror at ftp.spudster.org, I see:

ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/ACTRUN.ARC

Along with it is "ACTRUN.DOC" (a plaintext file) which states:

Additional programs not included here because they are binaries:

RTSCAN.COM - run against your source file to produce a listing
showing which RUNTIME.ACT routines are actually required
by your program. Allows you to trim out unneeded
routines to save symbol table space, etc.
RTWRITE.COM - If you send the output from RTSCAN.COM to a disk file,
you can then run RTWRITE on that file -- it in turn
outputs the trimmed down version of RUNTIME.ACT for
you.

And lo and behold, it looks like at least RTSCAN.COM is available in the
same FTP directory. One is an ACT file, and then there are 3 COM files
for some reason:

ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RTSCAN.ACT
ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RTSCAN.COM
ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RTSCAN2.COM
ftp://ftp.spudster.org//pub/Atari/CTH/Programming/Action!/RTSCAN3.COM

I hope _that's_ what you're looking for! :) Good luck!

And this file INCLUDEs a few others, which are also in that directory,
in case anyone cared. (RECORDS.ACT, RUNTIME.ACT, RECUTILS.ACT & FILESCAN.ACT)

Yes, the Viewsonic NextVision N4 has worked great for me. It was
expensive, but it's a great option for hooking up A8 to VGA monitors.

Hey, may as well make use of that MDA monitor for something
worthwhile!

It should be a drop in replacement, but you should look at why the thing
burned out too.

Mark

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

It is overheat... :-(My Atari 1050 US doubler is overheat too. Drive #1
does not work. Switch to 2, still doesnt work either but 3 and 4 drive work!
I smell no burned chip on the 1050 board. How do I find chips that control
the switch?

Thanks!
Jack

I'm having a senior moment so...

I seem to recall the RTSCAN did not pick out everything you needed from
the RT library. Just something simple like you need to include
copy_parms() even though it isn't listed. There is also ~BIGSYMBL or
something like that to give you a larger symbol table. If your program
grows to 16k or so you will probably need it.

There are work around for the symbol table if you can't find the
utility. Mostly you use definitions to eliminate procedure calls.

That is my hope! :^) Dunno if _I'll_ ever get around to it, but... :^)

At the least, I might make a simple little drum machine tool, kinda like
Syn, but simpler... and for drumming. :^)

Or better yet, how about using the 1010/410 recorder to play actual
music? YOu could make a template for each song on the tape so the
screen would be synchronized to the music.

I'm pretty sure I finally got rid of my 1010 tape drive. :^)
But yeah, that's another possibility. Of course, that lowers the number of potential players to those who (1) still have a 1010 drive and (2) have the same audio cassette as you. ;^)

THESE days, it might be easier to whip together some kind of SIO2PC-cable-controlled music player for Win/Linux/Mac and provide MP3s or OGGs for people to play. ;^)

well the cassette would be part of the package or like you say the MP3
which would prob be better off. Can you emulate a cassette recorder
with SIO2PC, you could do the same thing then?

That's too bad about RTSCAN. It sounded so promising.

I'm slowly getting a feel for which Procedures/Functions I can leave
out of the runtime but it's a pain. I was hoping RTSCAN would help.

Already had to increase symbol table space for one of my programs but I
also already forgot how I did it. [Guess that's my senior moment...but
I've got a few years to go]
```

Thanks for the help.

Hi,

74LS38 is the Id of a standard logic chip; they are all alike, regardless
of the vendor.

> It is overheat... :-(

But if so, check why. If the chip has to provide more power, then try to
replace with a 7438 or 74F38, which are able to drive more current than the
LS variant. They're otherwise compatible.

> My Atari 1050 US doubler is overheat too. Drive #1
> does not work. Switch to 2, still doesnt work either but 3 and 4 drive work!
> I smell no burned chip on the 1050 board. How do I find chips that control
> the switch?

The switch isn't controlled by a chip, it is rather read by a chip but that
doesn't have to draw much power. The 1050 drive ID switch consists actually
of two independent switches: If it works as drive 1, and as drive 3 and 4,
then something else is wrong with your SIO chain because that means that
both switches are working. One can't encode three Ids with one switch.

So long,
Thomas

The thing about RTSCAN is that as the programmer you will know everything it will tell you. For instance if you do Graphics() procedure call you will know you have to include that from the RT library. I found the time it took to save, run RTSCAN, go through the list, copy the procedures from the RT library, etcetera, to be the long route for me. I got really good at using the two window feature of the Action! editor as well as the copy buffer. What I would do is just do a split screen with my program in one window and the RT library loaded into the other window. I would just use the cut/paste feature of the editor to move from one window to the other with the procedures I needed, then delete the RT library window.
>
> I'm slowly getting a feel for which Procedures/Functions I can leave

It becomes natural after a little while. I have a good example of doing it somewhere. If I can get the little woman out of my hair for a couple of hours I will post it.

Source record: 8038

Hi;
I picked up another 800XL today and it is SOCKETED!!! Looks pretty clean too. I have 1 slight problem with it. Starting with key '7' and moving to the right, all keys to the right of 7 do not work. 1 thru 6 are fine as are ALL other keys on the keyboard. Weird huh?

I tried cleaning and swapping the keyboard with another one - no luck. I was wondering if anyone else had ever seen this behavior?

Thanks

I was wondering if there are any simple 800XL ram expansions available.
Looking for minimal soldering, and 256k possibly 512k of ram thanks!

5542. Re: looking for simple ram expansion for 800XL

5543. Bug65 and TDLINE

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-27 23:31:51 UTC
From: charlie <charleycron@woh.rr.com>
Message-ID: <H3yCf.64472$PY6.58146@tornado.ohiordc.rr.com>
Source record: 7850

I've been playing with my Atari's again.

Basic Stock 800xl, homemade ape cable, AtariSIO/linux, Spartados 3.2g

So I've been able to run bug65 under sparta, but not today.

The only thing I changed was turning off the tdline!

That was it, turn tdline on, bug65 works. Turn it off, it will not run.

Anyway, thought that was kinda funny...

Charlie

>From a NOOBs point of view...

Soldering is easy... desoldering is not.

The Wizztronics can be simple and it can be a pain in the butt.

Depending on your 800XL you might have to desolder one 74LS158 and
solder in a socket.

Also, if you have the CO12296 ANTIC then you need two additional chips,
plus you have to desolder 30 holes on the Wizztronics board before you
can insert the new additional chips.

It was not a good first project for this particular NOOB.

- Steve Sheppard

5546. Re: 800xl keyboard problem

Newsgroup: comp.sys.atari.8bit

From: Kryten <kryten_droid_obfusticator@ntlworld.com>
Message-ID: <glzCf.8589$343.3677@newsfe2-win.ntli.net>
Source record: 7853

Looking at the circuit diagram:
http://homepage.ntlworld.com/kryten_droid/Atari/800XL/800XLF/800XLF.htm
the keys you mention all use pin 1 of the keyboard connector.
This goes to the signal OUT1 from RN1 from pin 14 of a 4051 chip.

If I were your I would look for a dry/broken joint somewhere between those
two points.

I doubt it is an ANTIC fault.

5547. Omniview XL

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-28 02:17:58 UTC
From: Jason Harmon <spam@sucks.com>
Message-ID: <TuudnTZ6IMI8TkfenZ2dnUVZ_sadnZ2d@adelphia.com>
Source record: 7854

Does anyone out there have a working ROM image of the Omniview XL OS? My real 130XE which contains a Ramrod board with Omnimon and Omniview died (probably bad RAM from the looks), so I don't have a way to make my own image right now for use with Atari800Win+. I've done some searches with XL Search, but non of the files listed are either reachable or have a valid 16K image that works (though I did find one for Omnimon there).

Thanks.

Jason Harmon

The assembled one is what I bought but I needed the extra chips...I
botched desoldering part.

It sits waiting for me to buy proper desoldering tools. I desoldering
bulb isn't good enough.

It's great to see another board back up. I couldn't log in under port
8888 though. Your main board looked cool though, and was extremely
fast - much better than the 300/1200 baud I originally did on my
Atari.

5559. Question about TBXL

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-28 08:34:08 UTC
From: David Bowden <nospam@spamsux.org>
Message-ID: <aLGdncVFftLgsUbenZ2dnUVZ_sWdnZ2d@comcast.com>
Source record: 7864

Ok, I recently installed a MyIDE kit in my 130XE and I am loving every second of it. Now that I have a fast as hell method of booting my Atari, I intend to use TBXL a lot more often. However, I have a question...

While it's not too much of a hassle, I'm not overly fond of having to load and reload TBXL from scratch every time I go to DOS and want to return to BASIC..

The question I have is if any of you guys know it's entry point so I could just run it straight from DOS without having to completely reload it?

I ran the file through DIS6502 and didn't have much luck determining a safe JMP point. While I haven't done it, yet, I am about to decode the file header and find out what bytes #3 and 4 point to. I believe they will point to $02E7, but all that gets me is a system hang.

If I could get around this little annoyance, I'd probably remove my BASIC chip altogether. :)

Thanks,
--

Thanks for your help.

This is the one version that I found on XL Search. The Omnimon ROM seems to work fine, however the Omniview ROM in the ZIP (hires.rom I assume), does not seem to work correctly. First the GR.0 text is a modified char set, which Omniview did not have. More importantly, calling the entry point to 80 column mode (X=USR(49152)), crashes Atari800WinPlus and does not work.

Thanks.

Actually, a desolder bulb works quite well even on the atari boards.
just dont be afraid to get it real close to the iron when ready to
pull the solder, thats why the tips are replaceable (1 of the reasons
anyway). I used bulbs and solder pullers a long time before I got my
pace station.

Ken

PS: I'll help you if you need it.

look at the last few bytes in the file to find what address is loaded
into $02E7 and that is the address you need to jump to. Unless tbxl
does some odd things when it starts then that should work. also, that
wont work if you have done some DOS command like copy, that wipes out
program data. hth

Dave.
There are several incarnations of Frank Ostrowski's Turbo BASIC.
Apparently you are using a .EXE/.COM/.OBJ binary loading version.
The original TB was a DOS 2.5 boot disk, autorun.sys, and it uses RAM under
the OS at
$C000 and above. I think it even moves the ROM into RAM.
I know Tom Hunt made a version that would work with SpartaDOS, I think I
know.
Since you're using MyIDE, then you also are using a custom ROM, that
probably
replaces the OS into RAM.
I guess I'm forgetting what I'm trying to ask.
What OS, DOS and TB versions are you using? You obviously have an IDE hard

drive.
Are you booting from the hard drive and loading TB from that?
I think Tom Hunt's TB version is called Fast BASIC or something like that.

Very confusing post about a problem that should be fixed by spraying
the drive selector switch with some Tuner Cleaner or Contact Cleaner
from Radio Shack.

I haven't yet checked this out, but for those who use Unix-like systems
(such as Linux), there's an X-based game based on the original 8-bit
Archon:

http://xarchon.seul.org

It's pretty close to the original and so is rather primitive by today's
standards, but if you still like "old-style" games, it's worth checking
out.

There was also the 1993 Archon Ultra for DOS. I've still got that (and the
original), but I haven't played it in a while.

5570. DGS Atari 8-bit CD-ROM $7 Special (until 03 Feb 2006)

Newsgroup: comp.sys.atari.8bit
Date: 2006-01-29 16:54:16 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1138553652.21578.0@eunomia.uk.clara.net>
Source record: 7877

Hello All,

This week (until 3 February 2006) I will be offering the DGS Atari 8-bit CD-ROM (commercial and PD combo) for the special price of $7 (2.50pounds for UK buyers), which is a $3 saving on the usual price. This price includes Airmail shipping to any country (first class post for UK buyers).

If you don't already know, the CD contains most of the DGS commercial Atari 8-bit products and the full DGS PD library (191 double sided disks). The commercial products include the PPP products QUICK programming language, SAM 80-col GUI (no extra hardware required), and games, along with the Digi-Studio digitized music package, all 26 issues of the DGS newsletter, and more. All products are in both DCM and ATR format, and have PDF versions of the manuals. A copy of the video we shot at the 1996 AMS show is also on the CD in MPEG-1 format. Full details with descriptions and screen shots are available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8.htm

Payment is by PayPal only, and there are payment buttons on the page. If you prefer, you can PayPal the money directly to me if you don't like using direct payment links.

There's plenty of background info on DGS on the main part of the website.

Dean Garraghty

Hi David-
I hate to be a wet blanket, but this has been looked at several times, and there just does not seem to be a straight-forward to do what you want. It was for that reason that the author included all the regular Dos functions internal to TB. I *think* the major problem is the use of the ram-under-rom. If you exit to Dos, I'm pretty sure you wipe this out, and reloading seem to be the only way to get it back. Fortunately with a HD, the load time is minimal. Here are some vectors for you to explore:

$000C $2080 Dosini

$C060 Program Init, pointed to by $02E2, $02E3 (Ram under Rom address?)
$12EA Program Run, pointed to by $02E0, $02E1 (Right in the middle of Dos?)

If you execute the Dosini address (jump through it) you will get the TURBO prompt, but you'll find the machine locked up.

I'm not sure about the TB cart. IIRC, you can't get back with your program intact, but you *may* be able to get back to TB by pressing RESET from the Dos menu. Alternatively, you can copy the Turbo Basic XL file to a suitable ramdisk, and then reload when exiting Dos -- almost instantaneous, but of course, your Basic program is gone. I'm quite sure in my "Floppy Days" that I automatically copied TURBOBAS.COM at boot-time. (Used a program from Analog, IIRC.)

If you do find a way around this, do let us know. This has been a (small) thorn in our side since TB first appeared.

$2080 is the correct address, but you'll have to patch your DOS:
Change the "run cartridge" command so that it does a "JMP $2080"
instead of "JMP ($BFFA)".

Running $2080 directly from DOS could (at least in theory) also
work, but only if the DOS loads the MEM.SAV file before starting
the program. IIRC most DOSes only load the MEM.SAV file when
you use the "run cartridge" command

I have been using TurboDOS which supports the fine "BAC" command.
Just enter "BAC 2080" once, then write the DOS files to disk and
now you can go back from DOS to TurboBasic by simply typing "CAR".

so long,

Hias

5573. MyDOS 4.53/4 & 130XE - How to use extended RAM as a RAMDISK?

Ok, so I'm using MyDOS 4.53/4 and Mr. Atari's MyIDE, and the one thing that has drivin me up the wall is how to get MyDOS to use the extra 64K as a RAMdisk.

I've looked into several methods, and so far, the ones I have looked at just don't work. I suspect it may be an issue between the RAMdisk utility and the MyIDE ROM OS, but I'm not certain.

Has anyone else racked their brain against this one and come up with an answer?

Well, I'm not normally one to reply to my own post, but I stumbled across
"Atari Ramdrive 1.0", but the links to their files are bad. However, I found
it on XL Search. About to try it now. Alas, it doesn't work with TBXL, but I
can deal with that...

Thanks to those who offered to help but I'll get around to fixing
it...eventually.

The big problem was my impatience. I didn't have so much as a
desoldering bulb so I tried to desolder by wicking with stranded wire.
Didn't do a very good job of it and I couldn't fully insert the IC. I
figured it was good enough and started soldering. That's when I really
ran into trouble. As I applied the solder (from the underside) the IC
wicked it up the legs, right through through the holes. Before I
realized what was happening two or three pins drew up way to much
solder.

Now I can't seem to get the IC out. I eventually did buy a de-soldering
bulb but that hasn't helped because of the mess I created on the top
side of the board. I also burned the board and caused some of the
tracings to de-laminate.

That's how much damage newbie can do! LOL!

There are a number of RAMDisk programs.
I think you have a 128K 130XE, since you
have 64K to dedicate to a ramdisk. You're using MyDOS 4.53 and want to use
TBXL also.
And you have MyIDE OS and interface (cart
port I guess.) with a large (for Atari) 3.5"
hard drive. ??

You don't say if you have tried the "stock" MyDos ramdisk -- ramboot.aut (or whatever it's called under 4.53/4). Must be renamed .AR1 IIRC. You have to set it up with the "O" command -- did you try this? (And after using the "O" command you must write the modified Dos files to save that configuration.) Does your XE pass the diagnostic memory test for its extended banks?

No, my MyIDE interface is the internal "MyIDE-XE" kit (which was somewhat annoying to install).

System is...

130XE with MyIDE w/ 20GB (it's the smallest one I have!) 3.5" hard drive, video circuit repair/upgrade, and stock 128K RAM.

As for using TBXL with a ramdisk, that's not that big a deal. What I need the RAMDisk for is to circumvent the bug in the MyIDE that corrupts HDD data when copying directly from, say, the partition assigned to D2 to the partition assigned to D1. That's all, really.

Before I got the MyIDE, I only used DOS 2.5 with my 1050s. And briefly used "OS/A+" or whatever the hell it was that came with my Astra 1620 (I got it at a yard sale for 5 bucks, it promptly went in the trash. I hated the drive and it's DOS). I LOVED the almost instant load of the DUP from the RAMDISK with DOS 2.5. Now that I have the MyIDE, it has, at most, about 1 second longer load time.

UPDATES SINCE PREVIOUS POSTING:
2006.01.27 MadTeam, Graph2Font 3.8.4.1
2006.01.27 Mark Grebe, Sio2OSX 1.0.0 (variation of APE or SIO2PC for Mac OS X)
2006.01.27 Shawn Jefferson, MyIDE Config 2.0, MyIDE Image Manager 3.0,
MyIDE Image Batcher 1.0
2006.01.15 updated: Taquart
2006.01.15 added: Infinity
2006.01.15 added: PMWD
2006.01.15 updated: Piotr Fusik
2006.01.15 added: Kostas Nakos
2006.01.15 Petr Stehlik entry moved under Atari800 Development Team;
Atari800 Development Team updates;
See Also links from other Atari800 entries adjusted
2006.01.12 MicroUSB.org, USBDOS 0.1
2006.01.06 added: Cosine Systems (CGM UKScene Radio Intro, 1K Party, Reaxion)
2006.01.06 Petr Stehlik, Atari800 v2.0.1
2006.01.04 added: Soudi (makeATR v0.06)
2005.12.31 Piotr Fusik, ASAP 0.1.0 (Another Slight Atari Player)
2005.12.31 Radek Sterba, Raster Music Tracker (RMT) 1.22
```

2005.12.30 MicroUSB.org, USB Enduser Driver Disk USBTEST Version 0.6
2005.12.30 BAKTRA, TURGEN SYSTEM 2 and other updates
2005.12.19 Draco, KMK/JZ IDE BIOS 1.10, FDISK II v.2.3, Diag v.1.2
2005.12.19 MadTeam, Mad-Assembler (MADS) 1.6.8, Graph2Font 3.8.4.0
2005.11.27 added: Freddy Offenga (rominfo)

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Subject: A

4JAYS (Jay Colen) 9/04
519 W 4th St
Antioch CA 94509-1246
USA
Shop Phone: 925-777-1160
Store Hours: Tuesday thru Friday 12-6pm - Saturday 11-5pm
http://www.4jays.com/
Vendor: new and used hardware and commercial software

8-Bit Classics (Corey Koltz) 8/04
Stevens Point WI
USA
http://www.8bitclassics.com/
Vendor: hardware and software

A-ONE Magazine - Atari Online News, Etc. 9/02
Dana P. Jacobson -- Editor
USA
http://www.AtariNews.org/
Publisher: A-ONE online magazine. weekly

Advantage Web Solutions & Computer Services (Jim Mason) 7/04
PO Box 561
Mason City IA 50402-0561

USA
http://www.jamess.com/
Developer: The Atari Weather Station -- build your own dedicated temperature monitoring station using simple thermisters and the provided software. Also available: source code listing, temperature data aggregation utility

Alhart Enterprises Presents (AEP) 9/02
c/o Paul V. Alhart
524 North Zee St.
Lompoc CA 93436
USA
tel: (805) 736-4624
Vendor: used hardware--mainly reconditioned disk drives: 810 (no case), 810 w/case, 810 w/Archiver, 1050, Rana 1000, 1050 w/doubler, Indus GT
Developer: AtariWriter+ Companion (disk), AtariWriter+ Companion II (disk), StarStuffer (disk), Search System II (disk), Atari BASIC Enhancements (disk), 8-bit TTL Logic Analyzer (disk), MagicCalc (disk), Games disk: Jacks Cargoship + Light Pen/(Light Gun) Tic-Tac-Toe (disk).
Publisher: RANA Repair Guide (book) - US$12

Altronic E.I.R.L. 6/04
Bolognesi 952
Bellavista
Callao 2
Peru
tel: (51)(1) 429-4298
Repair Shop.

Alltronics 8/05
PO Box 730
Morgan Hill CA 95038-0730
USA
Phone: 408.778.3868 Hours: 10am to 4pm Monday - Friday
Fax: 408.779.2608
http://www.alltronics.com/
Vendor: Atari CX85 Numerical Keypad, Blaster! Auto Fire Module, TV/Computer Switch

Atari800 Development Team 1/06
See also: Mark Grebe
See also: Christian Groessler
See also: Piotr Fusik
See also: Kostas Nakos
See also: Vasyl Tsvirkunov
Petr Stehlik (maintainer), Troy Ayers (Playstation 2), Michael Borisov (POKEY sound), Piotr Fusik (core developer), Mark Grebe (Mac OSX), Christian Groessler (Sega Dreamcast), Perry McFarlane (cycle-exact ANTIC and GTIA), Kostas Nakos (Windows CE), Krzysztof Nikiel (Win32), Jacek Poplawski (SDL), Vasyl Tsvirkunov (Windows CE), James Wilkinson (DOS, BeOS, Win32)
http://atari800.sourceforge.net/ or http://atari800.atari.org/

Developer: Atari800 2.0.1 - an Atari 400, 800, 600XL, 800XL, 130XE
and 5200 emulator for Unix, Linux, Win32, Amiga, MS-DOS, Atari TT/Falcon,
BeOS, WinCE, Mac OSX, Playstation 2 and other systems

AtariAge (Albert Yarusso, Alex Bilstein) 4/05
PO Box 27217
Austin TX 78755-2217
USA
http://www.atariage.com/
Vendor: new hardware, commercial software. Exclusive distributor of
Pixels Past products.
Developer: cartridges: Beef Drop (by Ken Siders),
Castle Crisis (by Bryan Edewaard)

AtariArchives.org (Kevin Savetz) 6/05
USA
http://www.atariarchives.org/
Vendor: exclusive software downloads: Simax Video Signmaker, Simax
Picture Disks; SCREENS by Joseph J. Wrobel; Slime, Fort Apocalypse, and
Dimension X by Steve Hales; Chicken, Nautilus, Protector II, and Shadow World
by Mike Potter; Dragon's TAIL (Toolkit And Integrated Library) by Ed
Churnside; Shark and OS/II by Matthew Stepka; Atari Program Exchange (APX)

Atari Bit Byter User Club e.V. (ABBUC) 11/02
c/o Wolfgang Burger
Wieschenbeck 45
D-45699 Herten
Germany
Tel./Fax +49 2366 39623
http://www.abbuc.de/
Vendor: PD/freeware/shareware, hardware, commercial software
Developer: wide variety including: SIO2PC(SIO2ST)-Interface, PC-Xformer Cable, Automatic 2-Computer Interface, Switching Power Supply (SPS), 8-Channel dig. Voltmeter (DVM), XL Switching Interface, Speedy 1050 upgrade, RomDisk, QMEG+ 4.0.
Extensive hardware schematics for sale.
Has obtained rights to many products including: KE-Soft, Klaus Peters Elektronik, AMC-Verlag, Compyshop
Publisher: ABBUC Magazin (disk mag), ABBUC Sondermagazin (print mag)
Repair Shop.

The Atari Times (Gregory George) 2/05
USA
http://www.ataritimes.com/
Publisher: The Atari Times online newsletter,
The Atari Times Compendium (paper book, published annually)

Atarimuseum (Fred Meijer) 6/05
See also: Mirage Interactive
See also: Sikor Soft
The Netherlands
http://www.atarimuseum.nl/ and http://webshop.atarimuseum.nl/
Vendor: new and used hardware, new and used commercial software including all Sikor Soft titles (new in box), exclusive distribution of (new in box) ANG titles, and (new in box) Mirage titles. ANG/Mirage titles: Bang! Bank!, Basicdup, Eureka, Hack Picture Program II, Mines, Operation Blood, Operation Blood for the lightgun, Problem Jasia (Johny's problem), Sh*t!!, Simple Minds, Tanks, T-34 the Battle, Thinker, Thinx, Tron, Whooops! 2, Zebuland Utility Disk

AV Toolbox 1/04
USA
Phone 800-235-3280 or 859-647-1077
Fax 859-282-8225

http://www.avtoolbox.com/
Developer: a number of composite video<->VGA conversion devices,
including the Cheese Video Box. Connect your Atari to your PC monitor!

Subject: B

B & C ComputerVisions (B&C, Bruce & Cathy Carso) 1/05
5917 Stope Way
El Dorado CA 95623-4716
USA
tel: (530) 295-9270 11:00 AM to 4:00 PM Monday to Friday (Pacific Time)
http://www.myatari.com/
Vendor: new/used hardware, commercial/PD/freeware/shareware

Eric Bacher and James Wilkinson 9/05
http://dis6502.sourceforge.net/ or http://sourceforge.net/projects/dis6502
Developer: Dis6502 1.9 (Atari 6502 disassembler for 32-bit MS Windows)

BAKTRA (Michael Kalous) 12/05
Czech Republic
http://www.baktra.wz.cz/
Developer: TURGEN 1.1 Beta (Data transfer PC > ATARI, generates WAVE sound
file with Turbo 2000 record), Marching Drums (Music in RMT), TETRIS (game for
PC, supports Atari joystick via LPTJOY interface), Ztraceny hornik (game for
PC, remake of Super Miner, supports Atari joystick via LPTJOY interface),
LPTJOY (unit for Turbo Pascal ATARI joystick handling routines),
TURGEN SYSTEM 2 beta (new version of the transfer utility)

Richard Bannister 1/04
See also: Chris Lam
Dublin
Ireland
http://www.bannister.org/
Developer: Rainbow v1.5.0 - port of Rainbow 1.4 (Atari 800 series emulator
for MacOS 9) to Mac OS X, Emulator Enhancer v1.4.1

Lee Barnes 10/04
http://www.mathyvannisselroy.nl/mydos.htm
http://www.mathyvannisselroy.nl/aspi.htm
Developer: MyDOS RAMdisk patches, Black Box ATASPI V0.42 ("Atari (Advanced)
SCSI Programming Interface"), Black Box ATASPI V0.41

Ullrich von Bassewitz 5/04
Germany
http://www.cc65.org/
Developer: cc65 2.10.1 - a complete cross development package for 65(C)02
systems, including a macro assembler, a C compiler, linker, librarian and
several other tools.

BBK Enterprises (Bryan P. Schappel and Barry Kolbe) 7/05
See: RTS Software

Michael Beck 5/03
Germany
http://www.rho-sigma.de/
Developer: Atari 8bit filesystem for Linux 0.1

Matthias Belitz ("msc") 10/04
http://www.birmanns.de/atari/
http://www.mathyvannisselroy.nl/aspi.htm
Developer: msc-IDE Controller (IDE interface for PBI/ECI -- sold out),
IDE software utilities: INSTALL.COM V1.03, SETUP.COM V1.13, FDISK.COM V1.10,
MAP.COM V1.10, HDINST.COM V1.00, LMAP.OBJ V1.03, CDPLAY.COM V1.0,
CDREAD.COM V1.4, IMG2DISK.COM V1.00.
Black Box ATASPI V0.40 ("Atari (Advanced) SCSI Programming Interface"),
ATASPI CDPLAY V0.20 (audio CD player), ATASPI MON V0.12 (SCSI monitor)

Bensley Consulting (Brett Bensley) 1/04
PO Box 301
Westfield IL 62474-0301
USA
tel: (217) 967-5465
Developer: Happy's Programs - Math, U.S. History, Astronauts, Triangles

Best Electronics (Brad Koda) 9/02
672 Commercial St
San Jose CA 95112-1406
USA
Telephone: 408-278-1070 (M-F 1:30pm to 5:00pm PST)
FAX 408-278-1092
http://www.best-electronics-ca.com/
Vendor: new hardware, commercial software
Developer: "XE" Touch, Best Joystick, Best Light Gun.

BeWeSoft (Jiri Bernasek - Bernasek-Werner Software) 8/02
Na Hrebenkach 42
15000 Praha
Czech Republic
Developer: BW-DOS 1.00/1.10/1.30, BW-DOS Update #2, Multi Dash, Multi Race,
Multi Worms (multiplayer-games for multilink/gamelink 2 hardware), Golfer,
H2O, Tetris 3D, Superpacker 1.0, Virus Scanner 1.0, Text Converter,
plus many other game and demo programs...

B.G. Micro 8/05
555 N 5th St Ste 125
Garland TX 75040-5097
USA
orders: 1-800-276-2206 or 972-205-9447 9am - 5pm CST, Monday - Friday
fax: 972-205-9417
http://www.bgmicro.com/
Vendor: Atari CX85 Numerical Keypad, hard-to-find chips for Atari disk
drives (per Russ Gilbert)

Big Five Software (Bill Hogue, Jeff Konyu, Curtis Mikolyski) 9/02
USA

http://www.bigfivesoftware.com/
Developer: Miner 2049er, Bounty Bob Strikes Back,
Bounty Bob Emulator for Windows NT, 2000, 98, and ME

Bravo Sierra Computers (BSC) (Ben Smith) 11/04
Oregon
USA
tel: (503) 256-9974 "Ben's Benevolent Help HotLine" 24 hours

God, I'm such a dumbass... That did the trick. I didn't know the RAMdisk
config was part of that. Like I said, I'm a MyDOS noob...

And, yes, my 130XE *would* pass the memory diag if I still had the Atari OS.
It's been replaced with the MyIDE OS, and with it, "BYE" coldstarts the
atari.

Thanks! :)

> If you execute the Dosini address (jump through it) you will get the
> TURBO prompt, but you'll find the machine locked up.

Not necessarely. The problem is not the RAM under ROM. The problem is
that the Dos will overlay the *regular* RAM part of TurboBasic with its
own data. Which kind of data is placed there, or whether data is placed
there depends on the Os.

For the Atari Dos'es (2.0S, 2.5) the DUP.SYS is loaded there and thus
breaks Turbo Basic. For OS A/+ and related (including my own Dos 2.XA/XL)
the command line propt is part of the resident DOS.SYS and thus *these*
DOS'es will allow to return to TurboBasic savely - *all provided* that
the command line doesn't require the memory for its own. This happens
for example for Dos Os/A+ and my 2.XA/XL series whenever you copy a file -
namely to keep the file contents, or if you load a binary file ontop of
Turbo Basic (quite naturally).

The solution to your problem is thus to use a different DOS, or not
to use the DUP.SYS. Then, returning to TB is really "RUN 2080".

Greetings,
Thomas

Hi-
Perhaps things have changed, but previously only version 3.3a of Sparta
would work with the MyIDE and it's OS rom.
Can TurboDos (or other) CLI-type Dos work with the MyIDE now? If the
problem is overwriting lower memory by DUP.SYS, then shouldn't using
MEM.SAVE with an Atari-type Dos work? I'm pretty sure that I tried
that some time ago and it didn't, but I'll try again. I am interested
in this issue!

I don't know.

> If the problem is overwriting lower memory by DUP.SYS, then shouldn't using
> MEM.SAVE with an Atari-type Dos work?

In principle, yes. However, MEM.SAV is typically only restored on the
"B"ack to Cartridge command, and not on the "G"o to hex addr command which
is required to restart TurboBasic. Thus, it doesn't work without
modifications on the DUP. See also Hias posting on this.

So long,
Thomas

> -Larry

Well, I tried running WinApe on the Dual 800 mhz G4 Mac. Had all loaded,
but couldn't get it to work with the serial to USB adaptor.

But I have heard of it working.

However, I have SIO2OSX working now, and it is a good virtual drive system.
Has bugs but the developer is busy working those out actively. :)

Many years ago I managed to get this working using DOS 2.5, I wrote a
small program that would modify DOS 2.5 to allow you to go back to TB
by selecting the 'B' option from the DOS menu.

Several years later New Atari User/Page 6 published the program. I've
been looking for the issue it got published in, but I've not been able
to find it. It's in one of the later issues, certainly after issue 61.
Unfortunately the online Page 6 archive hasn't got that far yet.

I should still have a copy of the file and/or binary on a floppy
somewhere, I could try to find that if any one is interested.

5588. SRAM Cart Project - works but I need help

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-01 01:47:45 UTC
From: stephensheppard@hotmail.com
Message-ID: <1138758465.617826.321910@g43g2000cwa.googlegroups.com>
Source record: 7892

I'll try to make this short (doubtful, LOL).

I've built 3 versions (same hardware just different wiring) of internal cartridges using SRAM. The project is basically a subset and variation of Bob Woolley's SmartOS.

All three configurations suffer from the same problem. I can store cartridge images in battery backed up SRAM but when I shut down the 800XL and power up I boot to black screen. The only way I can start the cartridge is by holding down the Reset button for approximated 7 seconds.

The hardware consists of not much more than one 32K x 8 SRAM which sits in the socket formerly reserved for the BASIC ROM. I do use two additional sockets as adapters so I can re-route or utilize A13 (for an addition 8K bank), A11 (because A11 from the BASIC socket is the pin normally reserved for /CS), Vcc, /OE, /WE (R/-W in A8 schematics), and eventually A14 will be used (for multiple carts). Borrowing from Mr. Woolley's followup article, SmartIDE for the 1200XL, I used the Dallas DS1210 SRAM controller (for the battery backup).

The three configurations.

1) Substituted SRAM for the 800XL internal BASIC ROM. No gates were used in first trial. /OE is enabled (fixed to ground), -BASIC signal to /CS (thru the battery backup circuit), R/-W signals /WE on the SRAM (I also have a switch to write protect)

I use my own software (simple Action code) to load the SRAM. I switch on write protect and initiate jump to the Coldstart vector. The cartridge then runs (or it doesn't).

On this trial, in addition to having the initial black screen problem on about 50% of the cart images worked. The others refused to revive from the black screen. Please note that I can turn of power and still revive the cartridge, with the Reset trick mentioned above.

2) Moved on to simulating external 8K cartridges. Instead of using -BASIC for chip selection I use -S5, just as an 8K cartridge does. To indicate the presence of an 8K cartridge I tied RD5 to Vcc. These are the only hardware changes from stage 1.

The software was changed because for a simulate external cartridge I could perform direct writes to address $A000-$BFFF. I didn't have to bank select the "BASIC ROM" as I had in stage 1.

Despite being basically the same hardware about 75% (vs 50%) of the cart images run but several have visual problems.

3) 16K cart emulation. Tied both RD4 and RD5 to Vcc, -S4 is connected to A13 of my SRAM to control two 8K banks. Used -S4 and -S5 thru an AND gate to signal chip select (if either is LOW then the SRAM gets selected).

I had big problems here. Only about 10% of the ROM images would run and nearly all of those were corrupted.

I eventually incorporated 02 (Phi2), I believe correctly or as per Bob Wolley's intent (but I'm no electronics guru, not even close, LOL). To be honest though, I don't understand how or for what the 02 clock signal is used in this application.

Eventually, I fixed many of my problems and am working on the others but the boot up isssue keeps nagging at me.

Here are my questions for the group.

Does the OS detect a cartridge, external cart or built-in BASIC, in some way that I am not aware of? My SRAM is write protected, AFAIIK the hardware should see the SRAM as ROM.

I'm aware that OS checks a zero value at $BFFC, and if it finds it then the OS assumes that $A000-$BFFF is RAM. I don't know if the OS tries to write to that range at this time. In any case, the SRAM is write protected via a switch.

Could there be timing issues, as in the SRAM responding initially too slowly or too quickly?

- Steve Sheppard

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Yes, you and Hias are quite correct. (Years ago,) I used the
disk-based version of Atari Microsoft BASIC for quite some time, and
knew that I used MEM.SAVE with it. It appears Atari had patched Dos
2.0s to do as you both suggest. -Larry

Hmm, but TB XL is not looking for values at
$0E-$0F, $6A, $80-$81 and $02e4-$02E8 ?
If you need ALL memory then nothing you can do,
but if you don't then you can do it without modyfing DUP.SYS,
just there will be less memory. I don't know TB XL,
but I just think it is compatible with ATARI BASIC in that
one particular thing ?

Curious... have you thought about IRC? It can be done from a text terminal
(e.g., if you have access to a Unix shell), and there are clients for
most OSes. (I'm be surprised if there were no Atari ST IRC clients.)

Of course, it doesn't have the nostalgic charm that a BBS has, but... :)

Here is a short intro and overview to Reanimator II, this months prize
game on The DarkForce! BBS. You'll have to play often to win! :-)

R e a n i m a t o r

... how did you get here? You can't remember for sure. All you can
remember are the sounds... the music of the spheres. You sense that
you were cast into this darkness by powerful hands... hands that
control your destiny... of someone with a power that you cannot
imagine.

You feel a strange surge within you, and you know you have changed
somehow... and you suddenly notice the book in your hands. You open
it to find spells of which you know nothing... conjurations of the
spirits... and the power to reanimate!

Then your become aware of one more thing -- you are not alone... and
from the constant probings within your mind, you doubt that they are
friendly.

One voice comes thru louder than the rest... it is the voice that
belongs to the powerful hands... "Destroy all others!"
"By Enlil, I command thee!!"

In Reanimator,you become a Necromancer at war with other Necromancers.
You must maintain a mighty army of undead soldiers in order to prevent
other Necromancers from dueling (using powerful spells) against you.

At the same time, you must increase your magical energy, strength, and
endurance in order to perform your varied options -- among them is the
opportunity to attack other Necromancers. Other choices include the
reanimation of the dead to create reinforcements, sending out zombies
on search missions (who knows what they will come back with), drinking
magical potions, and praying to your gods.

You will need your staff to cast those spells, so hang on tight! Other
magical items in your possession are the powerstone (used for storing
energy that cannot be lost as long as you are alive), and a crystal
ball (used to spy on other Necromancers).

The top _surviving_ reanimator will each month be added to the Hall of
Fame. Will your name be written there, N e c r o m a n c e r ?

Good luck all! :-)

I took the CF card and placed it in the 800XE laptop, which is running 3.1
and it came up. The program I am testing with is a binary file of
Montezuma's Revenge.

Also once on the 4.2 I received an error 135 when trying to load this
program.

You know of any good servers I can telnet into that has IRC? (I don't
think there is a IRC program for the Atari 8-bits yet).

Other than that, you can also hit the java Ataritimes.com chat on Monday
nights too, but the Atarinews chat is for the most part, there already, and run
by an Atarian who is happy to run it. So why not?

Naturally I liked the other chat room I was with around July of last
year... fun place, but last I heard went down. :(

5610. Must be a good day for video problems...

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-02 15:38:10 UTC
From: Slor <semaj@rols.ten>
Message-ID: <Xns975E6C3329559emuslor@216.196.97.136>
Source record: 7916

Ok, so I decided to do the 1200XL CLRPIC "sequel" video upgrade found here:

http://www.atarimuseum.com/computers/8BITS/1200xl/1200clrpic.html

About halfway through the work, I found a couple discrepancies, namely R188 was at least 900 ohms (I forget exactly, but it was over 900), and C62 actually had no component installed. Unsure why these differed yet still hoping the upgrade process was valid, I finished the work. My only deviation from expected is that I used a 1/2 watt resistor at R188 because I didn't have a 1/4 watt in the right resistance. I completed the changes and checked more than once for any soldering errors.

So, I hook the machine back up and turn it on with a BASIC cart in the slot. The characters in text mode are indeed very sharp (and quite bright as well), but the left side of the blue background is completely grey for a few columns. Also, I stuck my Galaxian cartridge in and found that ALL colors there are basically grey tones (it's possible there is SOME color, but it's very subtle if there is). At least one other game that I put in DID show color, so I'm not exactly yet how to characterize the modes that will show the issue. I might have more to go on if the BASIC mode wasn't only partially corrupt.

Can anyone help me characterize what might be going on here? Anyone seen a similar issue and/or know what would cause this? I can take a photo of the screen results as well as each side of the PCB if that will help. A couple notes:

- I have a second 1200xl that I opened up, and it had the same discrepancies in existing components as the first one. I had hoped it might have matched the list in the instructions so I could see what else was different if the 1200xl shipped with 2 different video setups.

- While looking for more info, I stubled across the ClearPic 2002 mod at http://retrobits.net/atari/clearpic.shtml. I might have done this one instead if I had found it first. I might still do it, but I'm hesitant to think that it's going to fix my issues because I'm sure the mod I did was a solid performer already. Seems to me I must have some underlying issue that should be determined before making another attempt that requires more components. Then again, if anyone has had this same experience, perhaps you can give another view.

Thanks!

Don't have an answer for you but here is another link for the orginal
ClearPic 1200XL article. This copy has the schematic for the completed
video. Perhaps it will help.

http://www.geocities.com/atarimods/1200xl-vm.html.

Thanks for the link. It's interesting that there are 2 more components to
remove and that the replacement for C62 is different in this particular
listing. The text of the mod, though, is pretty much the same with the
exception of noting that it's 16 rather than 10 components to remove if you
won't be using the RF modulator. I see no further reference to the RF
modulator, and this parts list is now 12 components to remove. I do see
the note that this is not the same circuit that appears in AC (presumably
Atari Classics - the link I used).

You think things will improve if I change C62 and remove the other 2
components?

Beats me.

Seems to me in the article to which I linked, Bob calls for a variable
capacitor 1uF to 10uF for C62. I'm not sure I'm reading that right
though.

As for the difference in the schematics, I don't have access to a copy
of the complete original Atari Classics article. (I never had the
privilege to read Atari Classics until some re-posts became available).
I am wondering if the original had the completed circuit or just the
1200XL original schematic.

I wish reprints/re-posts would include the date of posting and the date
of the original. Just a pet peeve.

Hadn't heard of it, but not surprised.

Of course, aside from that, simply logging into a bigger system (one with
a text-console-based IRC client) via IceT or some other terminal program...

Hey James, double check R188's location. I'm looking at the 1200XL
schematic. R188 is 750 ohms but R138 is 910. Did you get them mixed
up?

Nope - I changed R188. In my machines, both of them are 910.

FYI - I got the problems cleared up by completing the enhanced enhanced
mod. The author made one more update after I asked him some questions:

http://sog.com/atari/1200xl-vm.html

I think the video can still improve, but it's better than it was - and no
grey issues.

Off with their goolies.

5624. Which revision of SpartaDOS X?

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-04 03:04:18 UTC
From: Slor <semaj@rols.ten>
Message-ID: <Xns975FE08813BCemuslor@216.196.97.136>
Source record: 7931

Is there a particular revision of SDX that was considered "the one to use"?
I see there are at least 5 revisions, and I'm wondering which one I should
run with. Also, I'm assuming that cart uses a 27512 EPROM? I'd hate to
ruin the label by pulling it up from the markings on the chip. :)

thanks

It is because computer games these days aren't as fun as they used
to be. Why don't you open a classic Atari gaming cafe in your area
and let the vandals enter. When they leave, and that'll be late, they
will be happy and peaceful citizens.

5626. Piggybacking OS Rom/Eprom?

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-04 14:24:09 UTC
From: Larry <LLppwhite@aol.com>
Message-ID: <1139063049.073975.120080@g43g2000cwa.googlegroups.com>
Source record: 7933

In the January, 1989 issue of Atari Interface Magazine, there was an article "Install an Alternate Operating System in an XE." I'm sure that I've also seen this article on the web. This showed how to "piggyback" a 27128 eprom on top of the OS rom using a switch and pull-up resistor for selection. I tried this at the time, but never got it to work reliably. As I recall, sometimes it would boot, and sometimes it didn't. Has anyone else had success with this approach? It certainly *should* work, but didn't for me. On a similar note, has anyone used a 27256 with a switch to accomplish the same thing? Or has anyone done a "homemade" RamRod--type board with multiple OS? Thanks.
-Larry

5627. life extension of old computers thanks to opensource Contiki

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-04 16:53:14 UTC
From: big_d_316@yahoo.com
Message-ID: <1139071994.414820.219120@o13g2000cwo.googlegroups.com>

How many people out there believe that life of old 8-bit systems and old 16-bit systems life will be spared because of Contiki? I believe this OS is the answer that all 8-bitters have been looking for. I think it offers more than just TCP/IP to old systems. It is a common ground for all 8-bit systems all the way from Z80 to 6502, a place where new apps can be ported from one system to another with little modification. I hope in the future we can see it grow. Maybe see the GUI abilities advance on systems like the Atari, C-128 and Apple. See a version be ported to run on a 32k TS-1000 with 1541 floppy drive. An apple IIGS native version. and add in modules and drivers to take advantage of home brew upgrades on 8-bit systems like CF cards and ram upgrades, video tweaks, or accelerators. Or maybe versions that would run on old CP/M computers like Northstar, or even Altair. How about include single board computers like Apple 1 or Cosmac ELF? The future of 8-bit computers is still wide open, and it is nice to see an OS like Contiki to make them sore. So programmers develope for it, and make it grand. Users, use it, and reap from it's benefits.

http://www.sics.se/~adam/contiki/

Some of the 16 bitters perhaps. Not the 8-bitters. They will survive on
their own merits but it will be fun to try Contiki, if only for the
journey rather that the end result.

>I believe

There is some video of the C64 using Contiki to access Google at the end
of this video.

http://video.google.com/videoplay?docid=-4895240151804208219

>Maybe see the GUI abilities
>advance on systems like the Atari, C-128 and Apple. See a version be

GUIs first started appearing on the ZX Spectrum twenty years ago

http://video.google.com/videoplay?docid=-5899006623234946073

Since the Timex 1000 can achieve this resolution in software and since
peripherals, like ZX Spectrum mice, will fit the TS-1000 edge connector
then a GUI would be possible on the standard machine with memory
expansion.

It would be a bit Klickibunti though.

http://en.wikipedia.org/wiki/Klickibunti

The journey would be fun and I am sure some are planning it now :-)

These comments make a lot of assumptions, so I took time to respond and comment. But as this message was posted to several Usenet groups, I'll only respond in depth in comp.os.cpm where I normally hang out - that's my own policy. Go there if what I say below is of interest.

My short reply is that, based on my experience with people dumping old S-100 systems (1970's to early 1980's, CP\M, Z80 & 8088), is that not many of those systems will be saved from the dumpster just because some kind of new OS is also available for them. The biggest obstacle to saving old, big systems is the reluctance of owners to pack and ship 'em! There are already other OS's to try on those systems from years ago, a "new" OS is not revolutionary. I think most of the interest in the computers I'm speaking about is in their OLD OS's - but more power to those who want to soup them up, like building a hot rod from a 1930's car.

Contiki looks like fun, nonetheless. So thanks for the post!

Although First Star's packaging claims the screenshot shown on it (left pic) is an "actual game screen" from the Atari version, it's not a screenshot from the actual released version (right).

http://tinyurl.com/bj5pb

Now, the box for the PB version states for 400/800 only -- BUT if you look on page 2 and/or 3 of the manual, it mentions using it in a 1200XL! Check out the (awesome) atarimania.com site for pics.

I don't know much about the 1200XL as far as what it was or wasn't compatible with (it's always been my understanding that it was practically incompatible with itself...) but is it more compatible with the 400/800s than with the other XLs?

I prefer v.4.19 when using a hard drive.

Some useful programs will exit correctly, that will not with version
4.21.

Just my opinion.

Runs OK on my stock 1200xl with no Translator, wow gotta love that music.

I haven't had very many compatability problems, not any more than with a
800xl anyway.

Actually, on my 1200xl I can run the disk version of Star Raiders with the
Translator. My 800xl will not run it at all! Not the version I have anyway.

Charlie

That's interesting... I have noticed a few problems with 3.5F and 4.2I, but
I haven't been able to pin them down yet, as I've been messing around with
a lot of different setups (2.5" drives, a CF drive I recently bought (this
rocks!) and of course, working on the utilities that I've written for MyIDE
(which often have bugs that I need to track down. ;))

So a 1200XL is more compatible with 400/800, but still not 100%, right?

I never realized that Star Raiders had a problem with XLs. And the FAQ site I found doesn't list it either - http://www.faqs.org/faqs/atari-8-bit/faq/section-59.html Years ago I probably only had a pirate disk copy, and I don't remember needing to use a translator disk to make it work. Now all I have/use is Atari800Win. I checked through all the different copies of Star Raiders I have - some work and some don't. So I guess Atari or someone else fixed it along the way. I'm pretty sure that emu doesn't include the 1200XL with it's XL/XE option, and I can't find any ATR copies of the translator disks.

I did find a version of Star Raiders with a title screen! It's obviously a 'home-made' modification - the screen is a (nice) picture of the Star Trek Enterprise firing its lasers! This version is also compatible with XL.

I don't know if it's more comptablie with the 400/800. Just making an
observation, my disk copy of Star Raiders is no measure, the cart works
fine on the my 800xl's.

I like it because there's no basic and it has a fresh keyboard, and looks
nice.

You can find Translator here..

http://ape.dyndns.org:8083/MISC/TRANSXL1.ATR
http://ape.dyndns.org:8083/MISC/TRANSXL2.ATR

I don't have a copy of the 1200xl OS ROM, but I suppose I could get one out of my 1200xl if you really wanted it.

Where did you find the modified Star Raiders?

Charlie

I've uploaded it to my website now:
http://rjespino.tripod.com/8bit/dos25tb/dos25tb.html

I remember it was published in an issue in the mid 90s, it was a small type-in and I think it wasn't even listed in the index (just to make things easier ;)

I'm amazed I can still remember writing this, it's been sitting on a floppy for around 16 years now.

I checked a couple of internet sources, and I am still confused.

It looks as if the graphical contents of the top of the screen varies
between
one screenshot and another from the same platform.

http://www.atarimania.com/8bit/screens/astro_chase_first_star.gif
http://www.atarimania.com/8bit/screens/astro_chase_first_star_2.gif

I cannot recall seeing any moving planets when playing this game 20 years
ago, but maybe I am wrong.

Also, the font used for the first two of the three text lines does not look
like
the standard Atari font. I looked at a larger image of the cover art, to
exclude
the possibility that it was effects from the scanning process that caused
the
different look.

http://www.mobygames.com/game/c64/astro-chase/cover-art/gameCoverId,35187/

Obviously, the screen on the cover does not use the Atari standard font,
except for the third line.

I think line one and two are not based on a character mode, but on
the high resolution graphics mode. Look at the varying width of characters
in
the word "MINES" on line two.

What is the "PB" version?

Anders

> out
> of my 1200xl if you really wanted it.

That'd be great, if it's not too much trouble. I'd like the chance to
experiment with it a bit. Though there isn't an option in Atari800Win for
it, replacing the standard ATARIXL.ROM bios file with yours should work...

>
> Where did you find the modified Star Raiders?

Over the years I've gotten several dozen multi-game ATR files from friends
and such, and it's on one of those.

The planets on the 'takeoff/landing' screen don't move, but you're right-
the placement of them are different on both. The other difference is the
colors - the box pic is more blue where the actual is more yellow. Plus the
pic on the box shows the landing "x" area in 2 colors (blue with yellow
outlines); the release is all yellow.

>

The (original) First Star version used custom fonts. The Parker Brothers
and Exidy versions used standard Atari fonts.

>
> Obviously, the screen on the cover does not use the Atari standard font,

That's another difference - the "Press Trigger to Continue" line never
appears on that screen or durin any of the landing animations (that I know
of).

The only interesting thing I could find is the following excerpt:

> Regular web browsers require several megabytes of RAM and disk space.
> The Contiki web browser only needs a few kilobytes of RAM and no disk at
> all.
> With a code footprint of 9 kilobytes and with a total of only 4 kilobytes
> of RAM
> required, it might very well be the world's smallest web browser.

This proves what I have been thinking: a CP/M Web browser is possible.

Unfortunately, I miss time and money to do one.

And, so far, each time I have not been doing something, nobody else has done
it...

Yours Sincerely,
"French Luser"

I don't know about that. I was very interested when Contiki first came out. But it seems it was going really good for a while and died. There haven't been any updates in forever. Support for most systems never got out of the testing phase. I was really anticipating good support for the C128 on the 80-column screen. I remember thinking "If only I could browse the web and do email and newsgroups on the 80-column screen of my 128, even if it were only text mode) then that would be cool. But it never happened.

Yes.. I know everbody is going to suggest that I get in there and finish the code.. Well, unfortunatly, my time is limited and I'm already working on DTV stuff too much.

Which brings me to my next thing.. The DTV is where Contiki could REALLY shine being that it comes standard with 2 MB of RAM, faster CPU, 320x200x256 graphics. If somebody wanted to spend some time coding Contiki to take advantage of all that, it would be something else. Just have to figure out the best way to network it using the user-port and best way to get a mouse working on the joystick port.

I think that 8-bit processors are not really interesting anymore. The only reason to use an 8-bit processor might be that the systems and the processor are so simple, that there is a lot of educational value. Everyone can learn to understand a computer by starting on 8-bit processors.

However 16-bit processors are much more interesting. They are hardly any more complicated than 8-bit processors, but they do offer some very interesting extra's. More processing power, more memory, divide/multiply instructions, instructions for structured ASM programming, and even memory management (although often rather crude). All that, while hardly being more complicated than an 8-bit system (software and hardware wise).

There is only one 8-bit exception. I agree with David Murray that the DTV/C-one is such an advanced 8-bit system, that it could be worthwile to port Contiki to that.

I think that maybe it might be feasible to convert the C-one's design into a 16-bit system with an 68010 processor. Imagine having a 16MHz 68010 processor with 2 SID's (stereo through a mixer), 2 enhanced VIC's (two overlayed graphics planes, like the CD-i), 16Mb memory and 16-bit peripherals! And running Contiki. That would be a system that could actually DO something worthwile, other than being educational!

Stepping up to 32-bit systems is not worthwile (for running Contiki) imo. The next step in educational value would be something like a 32-bit ARM7 processor/core. But the new Minix 3 is probably just too much for Contiki to contend with.

Peter, you're missing one very large element: Nostalgia. People like
to see what they're beloved 8-bit systems can do with new technology.
This was the whole basis behind the CFFA card; Richard Dryer didn't
even own a GS at the time. The Uther card was designed to be run on
8bit Apple II systems as well, unlike the LanceGS. So deeming a system
"worthwhile" to port contiki to isn't the way to go, its more the
passion of the user base.

- Paul

I happen to be writing a book (my third, for what that's worth) about how to become an embedded engineer. Here are a couple of quotes for you:

--- 8< ---

Humor aside, it is a generally-accepted fact that the number of new graduate engineers of all types is shrinking (at least in the United States). Various theories are posited to explain this phenomenon. In the specific case of embedded engineering, I see several factors causing the decline. One such factor is the unavailability in this day and age of well-documented home computers of the style my generation enjoyed - Acorn BBC, Commodore VIC-20, Sinclair ZX Spectrum, and so on. Modern personal computers are black boxes designed to run shrinkwrapped software. They are shipped without programming tools and with no technical documentation whatsoever. Operating system vendors are actively working to confine software development to an exclusive club of licensees, and lower-level development at the direct-hardware-access layer is at best very difficult due to the unavailability of chipset documentation (in many cases due to the manufacturer's contractual obligations to preserve trade secret information related to intellectual property protection mechanisms), and the utter complexity and heterogeneity of PC hardware. In the good old days, we could develop a homebrew program on our Commodore 64, fine-tune it to the last instruction cycle, and show it to other people with pride. This type of skillset is a vital component of embedded engineering.

There are other factors that raise the bar to becoming an embedded engineer, too - and I'll deal with them in the appropriate sections of this book - but the point I'm making here is that it's simply more difficult these days for kids to experiment with what they have at home.

--- 8< ---

Intel's 8051 architecture is an industry-standard platform referenced in almost every engineering course. When spoken of in polite company (and even in books like this one), you'll generally see the number 8051 prefixed with the adjective "venerable". Personally, I would rather describe it as "decrepit", but it's a solid fact that the 8051 is still the world's best-selling microprocessor core. Barring some major

upheaval, this is likely to remain true for as long as the world is still manufacturing and using 8-bit micros(1).

(1) - This is not quite equal to saying "forever". As die sizes shrink, the packaging and bonding costs (bonding wires from the silicon to pins that go out to the real world) start to dominate the cost of the device. Raw 8-bit dice will always be cheaper than raw 32-bit dice due to their lower transistor count, but by the time the chips are packaged for sale, the price difference may be almost invisible. For some applications, it is foreseeable that there will be no real cost benefit to be realized by staying with an 8-bit architecture.

--- 8< ---

(end quotes)

As a learning platform, the 6502 is not a bad choice - it's actually a fairly neat architecture, and there are parts based on the core still in production. Having to work with the realtime side of a moving raster is excellent experience for embedded design.

The 68000 (and 010) are extraordinarily inefficient CPUs by modern standards, and complex to use and interface. There is little practical value in learning the M68K instruction set because it's practically a dead family.

If you intend to move up from 8 bits, it makes no sense to bother with 16 bits, you should go directly to a single-chip 32-bit ARM device.

With the exception of maybe the 8-bitters, any Atari computer can
display 80 column text. Although, since you need a web browser to get
to your site, anyway, why not just do it in HTML? That way it'll format
itself to fit whatever size the web browser's window is.

>

When the Atari 400 and 800 computers were designed - I personally think
that the 400's keyboard was it's letdown. If they had the foresight
to have had that keyboard upgradeable, and to enable a cheaper 800 computer
to get to the market, more consumers would have been enticed to the
Atari Computers, rather than to Apple or Commodore, etc.
Overseas the Atari Computers were very much overpriced with an importers
markup profit added to it, which made it horribly expensive, and this
continued for some years. And only with the decline of Atari, and the
appearance of so many competiting computers, did the price finally drop
to more affordable levels. If a cheaper pricing strategy was done at the
very earliest opportunity, Atari could have developed years of dominance
before the likes of the C64, Spectrum, BBC etc appeared.

Even though I have not seen a 7800 running, I presume from what I've
seen of the emulation, that the hardware never performed as per the
advertising, and expectations, etc.
It was not up to arcade quality or anywhere near it - it wasn't even
near the Atari 400/800 standard?
I think it was the underperformance, that that was the reason it was
never released initially, at first...?

They should have realised what they had, at the time.
The Atari 400/800 computers were ahead for their time, and they should
have taken advantage of that lead.

Harvey

You must be a programmer of unparalleled skills and not much interest
in low-level detail.

I create this psychological profile on the basis of the fact that you
neglected to mention Messyrs. gdb and gas.

He is he is :-)

Phoebus

P.S. I have it on good authority that Mr. make is not *that* good of a
friend. After all GCC can do without him (crushing Messrs.
Fingers-of-both-your-hands-from-typing-24/7) most of the time. Let's
consider him as only a passing acquaintaince :-P

5660. 1200XL collision detection

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-07 01:48:27 UTC
From: Russ Gilbert <russgilb@MUNGEsbcglobal.net>
Message-ID: <L%SFf.9871$2O6.3381@newssvr12.news.prodigy.com>
Source record: 7817

My grandson has begged a Atari setup. I gave him a 1200XL and
1050 with doubler and some old disks and carts.
I'm setting him up with a 1489C cable and a 486 notebook for
APE and Yogi's collection of games.
While testing out the laptop/APE, I got out my other 1200XL.
While playing some games, it wouldn't detect collisions between
players and stuff they're trying to avoid. eg. Elevator Repairman would
'BOINK' when he hits his head on an elevator. Keystone Kaper's
cop could run right thru planes and shopping carts.
Is there a possible chip that isn't working right? Or some other thing
I could replace to fix it?
Both 1200XLs keyboards didn't work so well, but I believe with a little
use they would work right.
Thanks

I don't think there ever was a disk version, it's just a dump of the cart.

Well, I guess I spoke to soon about getting the ROM out of my 1200xl. I got
something, it's size is 16384 just like the others but it does not work in
Atari800 running on linux, I think Atari800Win is based on the same code.
It doesn't work in atari++ either.

There is some code here http://ch.twi.tudelft.nl/~sidney/atari/

that "will produce the ROM images that are byte-for-byte equal to the ones used in a wide range of Atari 8-bit hardware"

, including the 1200xl. It did produce a 1200xl ROM that ran in the atari++ emulator. PEEK(65527) does produce a 10 in the emulator, just like my real 1200xl. But, the "ROMCRC-32" utility at the same site produced different values (than my real 1200xl) while running in the emulator, with the exception of the sefltest value, that was the same.

Anyway, if you want to emulate the 1200xl I suppose you need atari++. I'll send you the working ROM by email. If you want to produce the ROMS yourself, you'll need a working cc65, or a real 1200xl.

Anyone know an easy way to dump the ROM yourself? I searched the group archives at google and used a little basic program David Firth posted, but he was talking about dumping the 800 OSA ROM. I tried to pop in the XL locations, but I have no idea what I'm doing. I think I ended up using 53151-65535. I've tried binary saves from dos, bsave from MAC/65. Probably in over my head. Just for giggles I ran strings on both ROMS and the first ten lines are identical, so I guess I'm close? It was fun trying anyway!

Here is the code David Firth posted.

```
10 OPEN #1,8,0,"D:ATARIOSA.ROM"
20 FOR I=55296 TO 65535
30 PUT #1,PEEK(I)
40 NEXT I
50 CLOSE #1
```

Well this really isn't what the thread was about, sorry folks. Maybe send me the suggestions or code by email, that would be cool.

Charlie

Well, I must of been smokin crack. I pulled a working dump. :)

All is the same in atari++ except the selftest rom!

OK, The following is from a Newell disk, to move OS ROM to
RAM.
It seems straightforward enough, just copy all but $D000 to $D700.
I'm thinking that those addresses are for hardware chip addresses and
can't/shouldn't be accessed.
A BASIC program might go something like this.
10 CLOSE #1:OPEN #1,8,0,"D:OSDUMP.FLE"
20 FOR N=49152 TO 65535:REM $C000 TO $FFFF
30 IF N>=53248 AND N<=55040 THEN PUT #1,0:NEXT N:REM SKIP $D000 TO $D700
40 PUT #1,PEEK(N)
50 NEXT N
60 CLOSE #1
70 END

Newell's move OS to RAM M65:
10 .TITLE MOVE OS TO RAM
20 .OPT OBJ
30 *= $8000
40 START LDA #0
50 STA $022F TURN OFF ANTIC
60 STA $D40E

I think Contiki definetly helps the 8-bit, but to me my 8-bit systems will
never die. I use and love them just as much now as I did when I first got
them. Others may think differently.

Subject: Whatever happened to Datasoft ?!?
Reply to Author | Forward | Print | Individual Message | Show original | Report Abuse

Well,
since Datasoft once was (and still is) one of my favourite 8bit vendors
and publishers, whatever happened to them ?? (or to Intellicreations,
since datasoft is a tm of IntelliCreations) - andreas

====
Hello Andreas,
Bit of a late reply, but I didn't get curious about this myself until about
now. I may have some of it wrong, as it got harder and harder to
investigate as time went on, but here is what I was able to dig up.

It appears that
Datasoft was purchased by,
Intellicreations who was eventually purchased by,
The Software Toolworks who eventually became.
Mindscape and was then known as,
The Learning Company which appears to now go by,
Selectsoft Publishing (SelectSoft is a division of MPS Multimedia)... who
since 2005 has licensed some of the following well known publishers,
including:

Broderbund
Activision
Capcom
Infogrames
Atari
and Hasbro Interactive

Here are a couple of links to current information:
http://en.wikipedia.org/wiki/SelectSoft_Publishing
http://www.selectsoftusa.com/
http://goliath.ecnext.com/coms2/product-compint-0000291252-page.html

MPS Multimedia Inc.
Private Company, Headquarters Location

138 West Harris Ave., South San Francisco CA 94080-5925, United States
(650)872-7100, (650)872-7133 fax, Primary SIC: Computers Peripheral Equip &
Software, Primary NAICS: Computer and Computer Peripheral Equipment and
Software Merchant Wholesalers
Description: Wholesale: Software distribution.

This company has been bought, sold, cheated, traded, beaten up, dumped,
thrown out the gutter, cut up and spit out, and tossed too many times to
count. Datasoft is hereby officially declared dead and buried. They
probably had it coming too, with the way they cheated Philip Price out of
his very well deserved royalties for a very good game.

Apple doesn't quite fit this picture. To paraphrase:

Modern Mac computers are white boxes designed to run preinstalled and
shrinkwrapped software. They are shipped with a DVD full of programming
tools and technical documentation (xcode, gcc etc). Additional support
is available via Apple's website. Apple are actively working to open
software development to anyone who is interested because it is in thier
financial interest to see more Mac software created. Lower-level
development isn't something that anyone should want to do except for
very small programs. Even on a Z80 programs with more than about 8K of
code soon become difficult to develop in assembler without introducing
bugs. I think the PowerPC chip set is pretty well documented, but of
course Apple is in the process of switching to Intel. At least hardware
conflicts of the type experienced by PC owners are still rare on Macs.

I know there are some people who just bought a G4 based Mac that was
replaced by a cheaper Intel based one but I'm quite happy to have a G4
system (when virus writers finally get around to attacking the Mac I
doubt they'll be doing fat binaries). However I'm still very much
attached to the idea of RISC processors, since it does make lower level
stuff easier. I hope 10 years from now when I buy my next computer
there's still a choice rather than just ubiquitous x86 boxes. Maybe
someone will have successfully revived the Amiga by then? Guess not. :(

If you're sure it is the right ROM image, please sent me the code and
I'll have a look on whether it is a usable ROM dump, and if it is, I'll
fixup the emulator code. It *should* work, though, because there's a
1200XL ROM support in atari++.

> There is some code here http://ch.twi.tudelft.nl/~sidney/atari/

That depends on the options of the emulator. By default, it installs a couple
of ROM patches for the H: device and to speedup the SIO transfer. You can
disable these, though. Due to these patches, the checksums will differ. If
you want "all the original", disable the SIO patch and the H: device handler
and you should be fine.

It's not that easy. With the standard DOS (2.0S at least), you cannot save
ROMs to disk with BSAVE. Furthermore, you won't be able to save the selftest
ROM like this. You first need to enable the selftest, then dump manually
the lower Os area, 0xc000 to 0xcfff, then the selftest, then the upper Os
area, in that order.

```
> 10 OPEN #1,8,0,"D:ATARIOSA.ROM"
> 20 FOR I=55296 TO 65535
> 30 PUT #1,PEEK(I)
> 40 NEXT I
```

> 50 CLOSE #1

No, that's only the upper Os area. Enough for Os/A and Os/B, but not for the XL series.

So long,
Thomas

Sure they can be accessed, and they should be dumped. It's the selftest
in that region. It's just not visible there because it is banked in
elsewhere when enabled.

So long,
Thomas

Hmm, nostalgia for me means that I like to have those old computers as original as possible. So running Contiki on a C64 does nothing for my feelings of nostalgia. Running GEOS on a C64, however, is a whole different thing.

Sadly the instruction set is a dead family. But it's NOT complex to use and interface, on the contrary. Maybe you only have experience with a Commodore Amiga, which does have a fairly complicated architecture. But if you look at simple 68000 designs, they are not much different from the older designs around 8-bit computers. An 8088 is much harder to interface, with all those stupid clock phases and it's silly memory map.

I've been working with Coldfire a lot of late. Using assembler on it is like a
time warp back to when I was using the 68K family back in the late '80s.

Ah. I dont know why I couldnt get anything to work the other night. I just
tried again and the 1200xl ROM from the atarirom package works even in
Atari800. My dump works too. I disabled the patches and now the ROMCRC-32
checksums are identical to that on the authors page. Thanks!

I really didnt think it was that easy, but what the hey it was worth a shot.
Funny thing is even doing it this way I got a working dump, at least enough
to get sparta rollin and run the crc util. But I really would like to make
my own proper ROM, so I'll give this a shot, thanks again.

I recall just accessing some $D000 addresses will cause bank switching.
The selftest vector is at $E471, which in my 1200XL is a JMP $FCE1.
So, I don't think self test is in $D000-$D700. I still think this area
requires some special handling. $D000-$D0FF is GTIA, $D100-$D1FF
are unused, $D200-$D2FF is POKEY, $D300-$D3FF PIA (PORTB,A),
$D400-$D5FF Antic, $D600--$D7FF unused, not empty, $D800-$FFFF
10K OS ROM.

I agree. Me too! AOL! Or whatever.

Although I've been working with Contiki, which is a cool project but
nothing that nostalgic people will reflect over. Maybe enthusiasts
who have wired their own network card but lacks an OS to run it with.

(quite a bit of cross-post, and still several relevant groups are
missing)

What I liked about the M68K instruction set is the way it still was tailored to handcoded assembly programmers. The Commodore Amiga became a success because all the C64 6510 hand coders got a processor which was easier to code for, was faster, and more versatile too.

The 8088 on the other hand had such an ugly instruction set that it was shunned for years by the people who matter :D. Thats the main reason why the PC had so few games in the 80's. Only with the 80486 Intel's instruction set was cleaned up so much that I would dare to hand-code assembly for it. And that really means I will *never* hand-code assembly programs for it *ever*, as today's programming tools are so much better and the processors are so much faster.

The ARM is a RISC processor, and RISC processors are not really suitable to hand-coding. Assembly code for a RISC processor needs to be optimized to have it make use of all the advanced features. Unoptimized code is often slower than unoptimized code of CISC processor, while optimized code may run MUCH faster than optimized code of a CISC processor.

So stepping over to ARM and hand-coding for it to learn about assembly language is not very efficient. Better to start on the M68K and then going on to ARM. Things like 'pipeline' and 'branch prediction' will be a lot easier to understand for a student.

Did you know, by the way, that the 6502 processor (or at least the 65xx family) is the worlds first microprocessor to have a pipeline (or so I was told at school)?

Actually the ARM is the RISC micro you're most likely to need to
hand-optimize. Writing high-performance ARM code, especially when
interrupt latency is a problem, involves dancing between 32-bit and
Thumb modes, and _very_ careful juggling with register usage.

I remember the XL/XE self test is a bank switch area in lower
memory. In XL/XE the self-test code is at $5000 and is bank switched
enabled when PORTB bit 7 is 0ed. So, there's OS ROM at $5000, how
do you handle that in a ROM dump? The code is from $5000-$57FF.
This is a bank switching function. I think the code that 1200XL jumps
to in upper $Exxx ROM does the bank switching and jumps to the
$5000 code.
Sorry if I'm confused. Just trying to figure how to make a
good dump of 1200XL ROM.

> Sorry if I'm confused. Just trying to figure how to make a
> good dump of 1200XL ROM.

The point is really that the selftest *IS* at 0xd000 to 0xd7ff, just
that it is not visible there unless mapped in. And if mapped in,
it appears at 0x5000.

Thus, to make a good dump, first

i) Loop over 0xc000 to 0xcfff, dump bytes there,
ii) map in the selftest by setting bit 7 of 0xd301 to zero
iii) dump the area from 0x5000 to 0x57ff
iv) disable the selftest
v) dump the area from 0xd800 to 0xffff

The problematic part of all this might be that 0x5000 might or
might not be part of the RAM your basic program occupies. Thus,
your program should rather be short. The resulting binary is
really how the bytes are arranged in the ROM, in that order.
As you see, the "ROM hole" from 0xd000 to 0xd7ff fits nicely
into the selftest area 0x5000 to 0x57ff.

As for the 1200XL, it didn't have a selftest IIRC. Instead,
this part of the ROM just shows a nice "rainbow colored"
Atari Logo.

So long,
Thomas

OK, I don't think a small BASIC program would interfere with $5000.

I see how to dump a 800XL 130XE that have the self test now.
I don't think the 1200XL has the banking tho. The pointer to
where to do the self test (BYE in BASIC) is at $E471 and in
the 1200XL JMPs to FCE1, I think there's enough room for the
rainbow logo there without the bank switching.
In a Omnimon $E471 JMPs to $F2C9 and in my 800XL JMPs
to $F223.
If 1200XL doesn't do the switching, then just a dump from $C000
to $FFFF should work.

Most processors are going to benefit from a bit of hand-coded assembly in an ISR, so your point is moot.

What Peter was getting at is that writing hand-optimised assembler is an art form at the best of times, and doubly so an a RISC architecture. Someone cutting their teeth on assembler is much better off on a CISC than worrying about the branch pipelines and shuffling data between 128 registers...

Not at all. ARM is particularly challenged w.r.t interrupt latency, so it requires careful tweaking. It is also possibly the most broadly used 32-bit core, by which I mean it is found in big devices that are microprocessors, and small devices that are microcontrollers with no external memory bus and say 32K of internal flash/2K internal RAM.

These tiny ARM devices are being positioned to replace 8-bit devices in a large number of low-level control applications, many of which are not coded in C.

Learning to code in ARM assembler is by no means a useless skill, as it is directly applicable to modern-day engineering tasks.

AVR is a RISC architecture too, albeit an 8-bit one. Ditto MSP430 (16-bit RISC). Nobody would suggest that it is silly to learn these assembly languages.

Just as a point of note: When purchasing my 400, there was the option for a touch keyboard instead instead of the membrane, which I chose. It cost more, and there was also a memory upgrade for about enough to place my 400 $175 cheaper than the 800. I figured I could live without two cartridge slots. They were all possibly aftermarket items, but you could never tell by the look and performance. But these were the days when a "computer store" pretty much only dealt with one line, and was a hole in the wall.

> Overseas the Atari Computers were very much overpriced with an importers

Possibly. I like to think of this situation as the same thing that MSoft is doing with the Xbox360 pricing scheme. I hope they have learned the lessons past, or at least think the market has moved beyond the 80's. It is their game to play, I guess. Now all computers are readily available, in most stores. (except Apple, but that is a boutique). Why give a dumbed down version of your flagship product? This can only serve to antagonize customers.

> They should have realised what they had, at the time.
> The Atari 400/800 computers were ahead for their time, and they should
> have taken advantage of that lead.

Hindsight is 20:20, and so are my comments. Yes they should have, as Apple was the only other game in town (ignoring PC jr,, which tanked). In my day, the Vic was the only serious competition when it came to purchasing decisions, but really?

Source record: 7756

What I would have liked to have seen is a better memory system, perhaps with the 1200XL.

Imagine the system with a 20-bit memory bus (a 1MB address space). Split memory into 4K segments. There would be 16 registers, such that the top 4 bits of each 16-bit address would select a segment register to use for the top 8-bits of the effective 20-bit address. Of course, a separate set of registers would be used for graphics memory.

A clever re-write of the OS would allow it to be mostly out of the base 64K. DOS and BASIC could be included in the OS without using much RAM. And if the design had been in place before the 400/800 were released, the original OS could have been laid out to accommodate the bank selecting without breaking compatibility (putting all jump tables in the same 4K and such).

On the hardware side, they should have come out with a PBI-based floppy drive at the same time as the 800XL was released. Perhaps a drive with both interfaces, so that they would only have to market one to keep supporting older systems. (Can you boot off of the PBI? You should be able to; where are the programming specs for that? Why isn't there a PBI2PC instead of just SIO2PC?)

5701. Atari 8-bit Picture and Sound Programs

Was wondering what are the best programs on the 8-bit Atari to view
pictures such as .GIF or some of the other popular formats?

Is there one that will display Atari ST 16 color pictures or better?

Also Sound and Music files, What are the best programs to play
Sound and Music files?

Any that will play Atari ST Digitized Sound files or other Digitized Sound
formats?

I remember one that would display .GIF pictures, but it was slow and thats
been a few years ago. Hoping something better has came along.

Right, exactly what I meant. :)

It's actually even worse. Most opcodes of modern RISC processors are tailored to some specific high-level language (of course, mostly C or C++). The high-level language compiler can optimize way better for these processors than a programmer can do by hand. Typically, IF more optimization is needed, the programmer needs to only optimize one or two simple routines. Optimizing the rest of the code by hand just doesn't weigh up against the time it costs.

No, of course not, but optimizing for a RISC processor is simply more challenging than optimizing for a CISC processor. If you want to learn assembly, it's best to start with a CISC processor, learn the basics, and then step up to the RISC processor.

Hand-optimization will allways be needed, and a good programmer can probably optimize the code better than a compiler can. But hand-optimization only applies to small pieces of the code, like Interrupt Service Routines. Generally a program consists of more than just an ISR :).

And about 'RISC architecture'... Of course these days the differences between RISC and CISC are pretty muddy. A Pentium 4 processor has all the characteristics of a RISC processor, but it still has a CISC instruction set. So does the AVR. The PIC, however, has an instruction set that is really RISC. Very limited, but every instruction is executed very fast. Often you need more than one instruction to accomplish something a CISC processor does in one instruction.

AVR is indeed suited for beginners. Don't know about the MSP430. But I'd say that the ARM is not for beginners. And I think Mark meant the ARM when he gave his comment :).

Hmmm.

In comp.sys.apple2, somebody posted a link to this chip:
http://www.winbond-usa.com/mambo/content/view/286/523/#ProductSelectionGuide

This chip is just WAITING for a port of Contiki, I'd say :).

This is the same processor as the SNES (Super Nintendo Entertainment System)
- albeit slightly faster ;)

Hardly. It's a masked part only (though without reading the datasheet I can guarantee that it supports external serial ROM also). This chip is intended for those multi-game TV games built into a joystick or other controller. It is a "me-too" part since Sunplus (a Winbond competitor in the toy market) had enormous success with their SNES-on-a-chip. You won't be able to buy the part at all without a quantity commitment.

Having worked with Winbond over a number of years, I can tell you their documentation will be grossly incomplete and barely comprehensible, their development system will be impossible to acquire without a personal relationship, and fiendishly difficult to use once you do manage to get it.

Dear Peter, I think you mean the i686. Look at the P4 Power-Ratings!
That Thing cannot be with RISC. Also the i586 Clone AMD XPxxxx... no
RISC.

There are some efficient Pentium available, but not the P4 :-)

(Microopcpode, ISSE3 ---- shite)

Well, the EE P4 is exceptionally. But 154W Power Consumption!?

The Pentium I use, needs about 26W and form in a line, between a
P4-2600 Standard (and XP2200), up to P4-2800 (XP-2400).
Memory latency is half as fast, as the fastest 64bit AMD Board and
faster than some Dual Channel 'DDR' 1600MHz FSB Boards (Standard 32bit).

I think time is needed, for coding RISC CpUď˙ž˝s. The 680xx is one of the
best CISC, beside the Z80. IMHO.
Although, I would say the percentage of Programmer on this world, is
still higher with 8bit than with 16bit (also many - older
win3.11/win32s coder etc.), or 32bit. I am not talking about C+ or C++.
Milking Machine etc.

Less is more!

Best Regards,

Daniel Mandic

Here we go again.
I really wish you'd stop talking out of your backside like this, you're only making a fool out of yourself.

Pentium 4 AKA i686 *IS* very VERY similar to RISC.
It's instruction set it CISC but is based on a microcode architecture that IS RISC. You just don't program directly in microcode. The chip translates the CISC instructions into much smaller RISC steps before they get pipelined.

And power consumption has NOTHING at ALL to do with whether a CPU is CISC or RISC.

Regarding your Omniview image:

1) Atari800Win Plus' SIO Patch is not compatible with Omniview 80
Column mode. Turn the patch off.

40 Column mode is OK. HD patch is OK. P: patch.

2) Uncheck the Disable BASIC option. This is also not compatible with
Omniview as Omnimon already has a Reversed Option Key function and
Atari800Win just gets confused.

If your image does not work after applying these tips then send me an
Email. My address is easy to unmunge.

Please use the subject ATARI because email from new people usually end
up in my Junk Mail Folder.

Along with A8JDPEG (mentioned earlier), there's APACView by Jeff Potter, which can view GIFs in various modes (including 2-, 4- and 16-greyscale modes and 256-color APAC mode), and break GIFs into 8-, 64- and 4096-color ColorView modes, which you can view with his ColrView app.

These days there may be some GIF decoders that can view in HIP and RIP modes, too. Not sure, though.

I stumbled across this page via Google:

http://www.chebucto.ns.ca/Services/PDA/Atari8Viewers.shtml

Along with what I mentioned above, it also mentions AT8GIF, which I THINK might be older than APACView...? It sounds like it can only do 2- and 4-color modes.

> Is there one that will display Atari ST 16 color pictures or better?

I don't know anything about Atari ST file formats.

Of course, these days the best way to do it would be to pre-convert the files on a modern system (e.g., a Linux, Mac OS X or Windows computer) and then simply view the files on the Atari. But, if your point is to do the actual GIF or JPEG processing _on_ the Atari, this is obviously not what you're looking for. ;^)

> Also Sound and Music files, What are the best programs to play
> Sound and Music files?

There's a MOD decoder and player for the Atari, that I had fun playing with about 7 or 8 years ago. ;^) These days, people seem more interested in playing Atari songs (stored in a format playable by PCs, using the proper software, called "SAP").

I can't really say what are the /best/ programs to play music, since there are numerous apps and trackers, and I'm not musical, so haven't really played with any of them in a long, long time.

Google is your friend.

Here's one starting palce, out of many:

http://grayscale.scene.pl/en_index.php

> Any that will play Atari ST Digitized Sound files or other Digitized Sound
> formats?

Again, I know nothing about ST formats, but along with MODs (which can include digital samples), there have been digital sound tools for the Atari since, what, the early/mid 1980s? :^) See also: Dean Garraghty. (Google is your friend :^))

> I remember one that would display .GIF pictures, but it was slow and thats
> been a few years ago. Hoping something better has came along.

Not sure anything better has come out. GIFs are so 1980s!
Where are my PNG and SVG viewers, huh!? :)

For optimization difficulty, RISC or CISC makes little difference;
superscalar or not is the big difference, and both CISC and RISC
machinese are superscalar nowadays. So even leaving branches out of
it, you have to maintain multiple parallel cycle counts. Add the fact
that memory access isn't constant (depending on cache) and you have a
real bear of a problem.

PowerPC assembler -- or ARM, for that matter, -- is much easier to
learn than x86 simply because x86 is still a 32-bit patch on a 16-bit
extension of an 8-bit machine, and its instruction set shows it. The
paucity of registers doesn't help either, though the direct-to-memory
instructions do.

>And about 'RISC architecture'... Of course these days the differences
>between RISC and CISC are pretty muddy.

About the only constant in RISC seems to be the lack of memory addressing
modes for any instructions other than loads and stores. That is, you
can't do arithmetic or branch based on a memory location.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Though I tend to agree with your conclusion about learning programming,
it is an error to think that optimization for a CISC machine is easier
than for a RISC machine.

RISC architecture was motivated by advanced compiler writers discovering
that straightforward use of CISC instructions was *not* optimal. Often,
much better speed could be achieved by ignoring the storage-to-storage
forms of CISC instructions entirely, and using, for example, register
loads and stores to move strings--not at all what the CISC architecture
suggests is appropriate.

Further, the procedure linkage instructions provided in CISC machines
were almost always either too much or too little for the job at hand
if optimality was the issue.

In virtually every case where the CISC architect had attempted to
close the mythical "semantic gap", an efficiency pitfall had been
created.

John Cocke proposed a RISC architecture precisely to regularize the
instruction set and match it to the hardware, so that an optimizer, in
generating code, would have fewer inefficient choices offered!

The demands that RISC makes of optimization is not combinatorial search
and simulation of all possible ways of doing a task, but simply the
repeated application of determinstic algorithms to allocate registers,
schedule instructions, etc.

Of course, as things have become more deeply pipelined, superscalar,
multi-level cached, etc., all machine architectures have become more
complex to program efficiently...

> processor does in one instruction.

CISC processors have assumed the implementation character of RISC
processors, but there is still a huge difference in what can be
directly expressed in the machne language.

A CISC assembly language programmer has little recourse but to
re-compute effective addresses that the RISC programmer would have
saved in a register for re-use. And the CISC programmer will have
to allocate some variables to memory that a RISC programmer would
have kept in the register file.

These differences make a considerable difference in advanced
assembly programming on the two styles of machine.

Actually, there are very few *specific* adaptations to programming
languages in most RISC architectures. The adaptations, if any, tend
to be to specific data representations--like IEEE floating-point, or
null-terminated strings, or, occasionally, to BCD data.

RISC architectures *should* be based on dynamic frequency, not on
a catalog of "nice features", and this eliminates most of the
traditional language-specific opcodes (since every language needs
load, store, and conditional branch ;-).

Many of the "decorations" that have shown up in the last ten years
are related more to simplifying optimization and implementations
in highly superscalar, deeply pipelined machines--like predicated
execution and branch hinting.

> Typically, IF more optimization
> is needed, the programmer needs to only optimize one or two simple routines.
> Optimizing the rest of the code by hand just doesn't weigh up against the

This, of course, is generally true, independent of architecture or
language.

They don't help if you want to go fast...you just have to find a way
to trick the CISC-to-microcode translator to do what you really want
it to do, in spite of the CISC interface. (The fact that the rules
change from generation to generation makes this quite problematic.)

>>And about 'RISC architecture'... Of course these days the differences

There are a few other things... fixed/regular instruction formats,
constant instruction execution time, large general register files,
data aligned on natural boundaries, all instructions implementable
by a simple combinatoric logic data path, etc.

You mean my Pentium is a wacky, unoptimized piece of multilevel cached
CISC (RISC). Downgraded to Milestones like 'ELITE II' or 'Tempest2000'
to see a bit of digital-art. (Not audible on actual systems)

You could easy say the RISC is better, but the time is wrong... or not?
Otherwise (meanwhile) the CISC-Base got their profits, but only to go
the way back!? hmmm. I am confused.

Yes, the RISC principles provided both an implementation advantage
(simple, non-state-machine datapath) and an overall advantage in
system-level cost-performance (removal of computation from execution
time to compile time).

CISC manufacturers, who owned the market, adopted the RISC-style
datapaths to capture the implementation advantage, and abandoned
the second advantage.

Agreed! I learned 65xx machine code back in the 80's from my C=64 and
C=128... (Which my Apple II using friends kept consulting me about.) I
picked up some Atmel AVR's, and very quickly wrote assembly language
applications for my band's MIDI setup. (Metronome, channel router and
keyboard splitter are the currently used devices.) I never considered
using a C compiler or a compiled BASIC.

If you press the help key at this screen you should get the self-test.
That's why the self-test in the 800XL (and above) shows keys for F1-F4,
even though those keys don't exist in the 800XL and above.

> -Larry
>

Hey Larry,

I've been meaning to do a mod like this for a long time and just never quite gotten around to it. Your email got me to thinking about it again so I tried it out. Using a 27512 with 4 ROMS burned into it in one of my 800XL's, I was able to switch between them using switches to ground on pins 1 and 27 (bent up) with 24K pullup resistors to pull the pins high when a switch is open. I haven't done any extensive testing but I was able to boot to each of the OS's

Looking at the pinouts a 272001 is pin compatible if you bend out 3 of the pins and overhang the chip on the left side of the socket. I've wired up a harness to connect to the last few pins on each side (1-3 and 29-32) to a 16 position rotary switch with pullups mounted on it. I used an 8 pin socket that I cut in half down the center to plug on to the bent up pins of the eprom. With this I should be able to get 16 OS's on one chip with just a single switch. I tested the harness on the 27512 and it works, so now I just have to pick out 16 OS's to burn onto a 272001....I'll let you know how it works.

Ironic that Atari took the time to remove the Easter egg from the 1200XL version of the keyboard test, but didn't bother to re-map the keys. It's like, they'd rather see a programmer not be credited for his work rather than put out a bug-free program....

Well, I burned 16 OS's to a 272001 and guess what.....It worked like a charm. I can now have 16 OS's of my choice available at all times. Also since I don't have to solder any of the wires to the EPROM, I can have as many OS's as I'd ever need just by swapping the EPROM with another.

So, now I want to know.....what are everyones favorite alternate Atari OS's and what special features do they have?

Btw, do the XEs have the same test program, and do they show the correct keyboard layout?

5748. 80 Column VT100 Terminal App

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-10 20:37:37 UTC
From: Jason Harmon <spam@sucks.com>
Message-ID: <HaKdnSW9LIuJZHHenZ2dnUVZ_vydnZ2d@adelphia.com>
Source record: 7655

Can anyone recommend an 80-column terminal app with VT100 emulation (and where to get it) for the 8-bit that works with the TCP/IP modem emulator in APE? I'd like to use my 130XE as a VT100 terminal for Linux, so something fast would be good. I tried IceT, but it didn't seem to recognize APE as an 850 (though this could be due to me not setting something up correctly).

Thanks.

Jason Harmon

Yeah, I put those photos up. (That's actually the manual, not the box.)

Someone gave me a "STAR RAIDER" cart a while back. When I went to take
a photo for the Wikipedia entry, I couldn't find my "STAR RAIDERS" one.

It was simply a misprint, and they didn't catch it until after making a
batch, apparently... :^)

You could try Flickr Term 80. I believe with both programs you need to
pre-load the R: bootstrap program before starting the terminal software.

This is probably called AUTO850.COM or something similar.

Wait, what was the easter egg? It sounds familiar, but I don't recall
ever seeing it. :)

And yeah... the non-reorganizing of the keys on later XLs seemed pretty
retarded. :)

All older stuff because I am not familiar with the newer ones with fast disk drive support.

My favorite when I was programming was Omnimon. Built in ability to interrupt any program and a combination [monitor, disasm, Primitive DISK I/O, asm] with a lot of features. Good compatibility too.

For compatibility Omniview was better then Omnimon. There were still some problems with programs that looked for a modified OS. Built in 80 column support, good compatibility, and IIRC it worked best with the Newell memory upgrades<built in ramdisk handlers> and with my ATR.

Modified XL. Just added PD hacks like fast FP routines, fast screen handler, left margin zero, default color darker so it was easier on the eyes.

Thanks for the info, I will Google some more.

Yes it seems most want to View or Play Atari 8 files on a PC.

I'm doing a small project on an Atari 8-bit and was wondering if any
progress
has been made in these areas.

Sorry, but the Pentium 4 is not i686. The Pentium 4 is ia32. The i686 is a RISC processor family of Intel. I believe it was meant specially for media purposes (audio, video), but I'm not sure.

Um...
I think you're slightly confused...
i686 is the general architecture, ia32 is just an even more general name for
it.
Pentium4(all 32bit variants), athlon(all 32bit variants) count as i686.
All pentiums (I,MMX,II,III,IV), 486s and 386, athlon, cyrix etc count as ia32

There has never been an "official" i686. They may have used the name
internally but since the 486 they haven't used the xxx86 name (has to do
with IP rights)
The cpu you are referring to is though an i960 (not an 860).. BTW: All
intel cpus from 486 onwards are RISC at least at their core. An extra
compatibility layer CISC interpreting Microcode is what makes them x86
compatible (I am oversimplyfing here of course)

5769. high density 1.2MB XF551

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-11 21:30:34 UTC
From: Jack Tseng <tseng4@hotmail.com>
Message-ID: <aIsHf.79741$QW2.64179@dukeread08>
Source record: 7676

The IBM 720K 3.5inch mechanism can be upgraded for XF551. Is it ok if IBM 1.2MB 5.25 is upgraded ? need modifying XF rom? Because 1.2MB can read 90K, 180K, and 360K disk as backward compatible. Use 160 * 30 * 256 bytes.

Yes it is so, they have had, at Intel, what they thought would be 686
and 586 developed in parallel.

I was in a presentation form the local representative of Intel and they
were describing their 586 and 686 projects.

What came out was Pentium and Pentium Pro, and they were much as they
had described. I think the floating point capability was the biggest
surprise (not thinking of the bug).

I think 80686 was a number they had already used for something entirely
different or maybe it was another company that had used it, which was at
least part of why they dropped the number.

Knut

Hi Jack-
Here are some obstacles that you would need to overcome (many!).
1) In order to provide 80 tracks, the 1.2 drive must be set to "single step" as if it were in HD mode. This drive must "double step" to provide 40 tracks.
2) It spins at 360 rpm vs. 300 rpm on a 360K drive.
3) The physical tracks written by the 1.2 are only about 60% as wide as a regular 360K drive to accomodate the 80-track feature. If you write a disk with the 1.2 and try to read it on a 180K or 360K drive, you probably would not be able to.
4) Unless you could figure out how to double the data rate on the XF board, you cannot put the 1.2 in HD mode. You are limited to regular DD MFM data rate of 250 KB/sec. -- 360K.
5) I'm reasonably sure that you can use a 1.2 mechanism as a non-standard 360K drive, but it is not recommended due to compatibility reasons. I've never done this, but I remember seeing a 5-1/4 + 3-1/2 "combo drive" on ebay a few years ago. The drive was used as 360K + 720K. And IIRC, someone was using 1.2's as 360K drives with an ATR 8000.
6) If you want to do a 1.2, then that's that, but a 720K/1.44 drive casts $10-15 new...
-Larry

Hi!

The most significant difference with the Pentium PRO is, that it have
speed-problems with "not" 32bit OS (Win9x/ME, DOS etc.). So a 200MHz
i586 is faster than the 200Mhz i686, in DOS for example, but never in
NT and so, not to mention the faster (full speed [200MHz at that time],
CPU integrated) 2nd Level cache.
They corrected that speed-behaviour with the P2 and P3 (bez MS wanted
to sell 9x/ME, I would say...), the so called P6-Core CPU´s. And the
Tualatin (though Pentium III) is again an i686, whatever this means
:-). I think it is the partly RISC build, why they call it i686.

The Pentium CORE have not been changed since the 'Microopcode P4',
which are made for Video and Audio purposes.... they have no thrust
:-)))
except the EE, but I would rather use its power for shopping and so :-)
0.22HP :-)

I did not know that the P4 is also having RISC parts.

Best Regards,

Daniel Mandic

Good luck.. they are no where near the same value.. considering you can
get a C64 for free pretty easy these days if you look around. Remember
the 64 is the largest selling computer (excluding the 'pc'), so much
so its hard not to trip over the damned things..

(not trying to start a 'which is better' flamewar here, just talking
current hard value.)

If you are getting 'boot error' it is when you are powering up with
a non-DOS or no floppy in the drive, or maybe even the drive isn't
configured as D1: If your formatting is working then you are using
a DOS disk and booting satisfactorily, unless you have a cart DOS
like SpartaX or MyDOS on cart.

Hmm... You've got 1050 set as drive 1 and XF551 set as drive 2.
You boot a DOS disk from 1050. You put the boot disk or
some other formatted disk, that drive 1 can read, in D2: and it
won't get a directory. Right? MyDOS will see what other
drives there are, you say that DOS recognizes there is a D2:
What happens when you try to access D2:? Does the drive
whirr or get error 144. How are you attempting to access
D2:?

> I recently picked up an OSS Basic XL cartridge off eBay. It is an orange
one, which says version 1.02 when it boots up. I believe the latest
version
made was 1.03. Does anyone know the differences between 1.02 and 1.03
(changes/features/bug fixes)? <

There were a few obscure bugs present in BXL 1.01 and 1.02. These were
supposedly corrected in 1.03. AFAIK, there never was an orange cart
(or "two-chip") 1.03. Conversely, there were a few black cart 1.02's
released. If anyone knows of an orange 1.03, please reply. 1.02 is
very stable, and the toolkit works well. I actually prefer BXL to BXE,
mainly because of the Toolkit and Runtime package.
-Larry

I tested the Single Density formatted disk on 1050. 1050 can read it. I
insert the same disk in XF551. XF551 still cant read it. XF551 is damaged. I
do not know what part is damaged. I think some chips are malfuctional or
5.25 mechanism. Which one is damaged?

Thanks!
Jack

Hi, Jack.
I seem to be the only one responding and probably the least knowlegable.
Are you sure the XF is configured, with dip switches, to be D2:?
Are you sure your DOS will recognize D2:, ie. some DOS 2.0/2.5
can be configured to only recognize D1:. What DOS are you booting
with? Are you daisy chaining the XF to the 1050 as D2: or replacing the
1050 with XF as D1: for boot? Does the XF respond at all to your efforts,
whirring, LED coming on?

H'lo again.
There could be a problem with the electronics, in which case you
could try swapping chips, if you can find a source.
Does the XF sound like the disk is turning, or silent when the
busy light comes on, ie. possibly the drive belt. A common problem
with the XF is the SIO socket coming broke at the PCB, check with
a magnifyer the traces at the connector. OK, not either of those,
narrows it down some. When you open it up, does the head move
back and forth, and the disk spin? Could be the stepper motor
or spin motor. I don't know which mechanism the XF uses, but
you might be able to replace the entire drive mechanism.

Where's Rick Cortese when we need him?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

5801. Re: XF551 chips for reading/writing ability

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-16 05:50:35 UTC
From: Jack Tseng <tseng4@hotmail.com>
Message-ID: <ZoUIf.81496$QW2.11316@dukeread08>
Source record: 7608

I command XF551 to format the disk. I hear the head moving fast during formatting. I think SIO in XF is ok. After formatting, it cant write as making boot sector and creating directory. The head moves back and forth as well ... motor is still running.

XF was the first happened to me. I forget to turn off the XF drive. It was left on in few hours. Heat sink inside XF felt little hot. It is not able to read. I turned off the drive for cooling down. The few hours later, the drive still cant read the disk. Any help?

Thanks!
Jack

5805. Re: Basic XL Versions

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-16 16:01:11 UTC
From: Jason Harmon <no@spam.com>
Message-ID: <9sidnXn_v63UPGneRVn-hg@adelphia.com>
Source record: 7612

Thanks for the insights.

I got the orange 1.02, and noticed a few interesting differences with Basic XE right away.

The indenting of loops in BXL is very strange. In BXE, the contents of a loop, but not the FOR and NEXT lines are indented. In BXL, the FOR and NEXT keywords are indented to the same level as the contents, which to me looks very strange.

In general, I would stick with BXE for my 130XE, but I also have an 800 and wanted a version that could run on it.

-Jason

If I am not too late on this thread and anyone knows,

Is there any type of code built into the MIO to handle the 80 Column board
that
was planned to be released?

Or was any software/drivers/etc going to be disk based, or on the 80 Column
board
its self, if anyone knows.

Hi, Jack (never yell that near an airport... :-)

It is definitely not an SIO device.

The MIO and the Black Box both connect to an Atari via the PBI
interface
on the XLs and the Enhanced Cartridge Port of the XEs; the Floppy
Board
connects to the Black Box. I have not seen them attached to the
XEGS.

It takes DC voltage. But don't use the 9v that is used on the 1050 series
as it will blow the power supply. You can use a power supply from an Atari
5200.

5810. Re: XF551 chips for reading/writing ability

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-17 05:25:25 UTC
From: Shawn Jefferson <sjeffersonTAKETHISOUTTOREPLY@shaw.ca>
Message-ID: <7bnav1947v6is5uh4rq685cv19da01peb6@4ax.com>
Source record: 7616

Hi,

I don't think this is a typical problem of the XF551, so I think you are
going to be on your own a little bit. I would resolder the SIO pins just
for good measure (be careful, the traces on the XF551 are very weak) since
that is such a common problem.

Other than that... well, I would probably personally try some guerilla
troubleshooting, but I'm not too keen to offer those suggestions to you.
There must be someone who knows more about electronics and the XF551 that
can help you.

"Jack Tseng" <tseng4@hotmail.com>:
>I command XF551 to format the disk. I hear the head moving fast during

hi phantomm,
no, not too late.

the code to handle the 80 column was to be put into the same ROM
that holds the MIO driver code iirc. but that code was never released
as far as I know.

BXE is by far the best for the 130XE, the FAST command kicks ass, as well as
the command to use the extra 64K automatically, I forgot what it is. I did
my advanced level project in BXE back in the day, very modular.

That would be the "EXTEND" command, which moves the program code to the upper 64K of memory, leaving all of the available conventional memory for variables/data.

Gives you a combined total of ~96K of space available, much more than any other Atari BASIC.

5814. [ANNC] Dis6502 2.0 released

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-17 16:06:35 UTC
From: Slor <semaj@rols.ten>
Message-ID: <Xns976D71076DB30emuslor@216.196.97.136>
Source record: 7621

Eric has released version 2.0 of Dis6502 at

http://sourceforge.net/project/showfiles.php?group_id=145747

New features:
- DIS6502.exe can be run with a filename as a parameter. The type of file
is guessed from its size and its header.
- Dis6502 now supports read and write labels for memory locations
- Dis6502 is now compatible with wine under Linux. You have to download
the TrueType font file Atarcc__.ttf which contains a font called
"Atari Classic Chunky". Copy this file in .wine/drive_c/windows/font.
Download at http://www2.bitstream.net/~marksim/atarimac/acttfpc.zip

Fixed bugs:
- Merging contiguous segments could crash the application
- After disassembling, the disassembly window is synchronized with
the bytes selected in the dump window.
- The small assembler does not accept illegal opcodes anymore to avoid
generating $1A for NOP mnemonic
- Opcode $54 in Display List is now correct in disassembly listing.
- Dis6502.ini is now read from the installation directory, not from the
current directory.

5815. FA: Assorted Pocket and Handheld Computers (Atari Portfolio Plus Extras)

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-17 18:02:44 UTC
From: pwborders@gmail.com
Message-ID: <1140199363.997638.257860@g44g2000cwa.googlegroups.com>
Source record: 7622

I have been cleaning again and I have an assortment of small computers listed on ebay until Saturday afternoon. They are all in great shape and work. I have replaced all the batteries in them (talk about expensive) except where there are rechargable batteries. Hopefully someone on this board might be interested in one of them, they can be quite fun to experiment with.

For a list of whats there, to place bids or for more information and pictures go to

http://search.ebay.com/_W0QQsassZtcbordp

You may want to change you listings to have the images open in a new
window instead of replacing your listing.

5817. Program to read SpDOS directory from MyDOS/2/2.5

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-17 20:38:22 UTC
From: Russ Gilbert <russgilb@MUNGEsbcglobal.net>
Message-ID: <2vqJf.13982$2O6.944@newssvr12.news.prodigy.com>
Source record: 7624

I wrote a program to read SpDOS directory from any DOS.
Somebody here gave me the idea.
You can download it at:
http://briefcase.yahoo.com/russgilb@sbcglobal.net
Just click on the Read+Sparta... .zip file and download it.
Let me know if you try it.
Oh, it can't do subdirectories.
It can't do DOS functions like copy, delete, run, etc.
Just a directory lister.

5818. Lantronix UDS-10 FAQ?

From: Rory McMahon <rorymcmahonNOSPAM@yahoo.com>
Message-ID: <2h1dv11mertsp5lbl0tqhdgdudhl7tnolb@4ax.com>
Source record: 7625

Hi all,

I picked up one of these and need to find out how to make a serial
cable. Anyone have a FAQ or webpage for connections? I would be
hooking it to port 1 of an 850 or Black Box serial port.

TIA,
Rory McMahon

On the lantronix side it is standard RS-232. I believe the blackbox also has standard RS-232. But the 850 has a different pinout. Let me know which one you will use and I can help you - I built one myself for mine.

Source record: 7630

Somebody had trouble downloading, somebody else got the
file OK.
After you go to the URL, you have to click on the 'My Documents'
folder, which opens to 'Read SpDOS dir from any DOS' .zip.
Just click it and download it. Thanks for interest. The
long 'Read...' filename will be OK in most browsers, methinks.
It unzips to T7.COM, the Atari executable.
This is the first time I've tried the Yahoo! briefcase to make
a file available to the internet.

5826. controlers for emulators

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-19 21:39:57 UTC
From: Preston Crow <pc-usenet05@crowcastle.net>
Message-ID: <pan.2006.02.19.21.39.56.955848@crowcastle.net>
Source record: 7632

I've got the atari800 emulator working with my MythTV system. Now all I have left to set up is appropriate joysticks.

I've considered the Stelladaptor, but I have a lack of working joysticks, and I never found ones that really lasted. It also seems weird that they didn't get a single adaptor for a pair of controllers for multi-player games.

I've seen some really interesting possibilities like the X-Arcade controllers, but why do they insist on setting it up so that you use your left hand for the joystick? Also, most of those controllers are set up to mimic a keyboard with the Mame settings, which isn't very friendly for use with a non-console emulator.

Thoughts? Experiences?

I want something that durable that I can turn our foster kids loose on.

I still have my original Wico ball-handle joystick from 20+ years ago and
it still works. Love those Wico joysticks.

(doesn't really answer your question however.)

FamilyNet International Newsgate

I would say stop by www.atarimax.com and get a SIO2PC cable. That is what
I suggest to anyone just starting out. With that you will have access to
literally thousands of disk images. And with that setup you can access the
internet with your 8-bit Atari to the internet through the Pc.

Good stuff. And then you can naturally add more from there at a leasurely
rate. But yeh, SIO2PC cable and the APE software he offers there.

5831. Free in SF Bay Area: 1200XL MB, SX212 & more

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-20 22:57:03 UTC
From: bill@newbreedsoftware.com
Message-ID: <43fa493f$0$58052$742ec2ed@news.sonic.net>
Source record: 7637

I have the following Atari 8-bit stuff available, for free.
A bunch of it was stuff I didn't know I had, but was being kept in storage
by my father (along with countless floppies I have yet to go through :^)).

The condition: you have to arrange to pick it up from me in or near
Mountain View or Palo Alto. (I may also be able to meet up in Davis or
Sacramento on a weekend.)

Please contact me directly via e-mail if you'd like any or all of this.
First-come, first-served!

* Atari CX85 numeric keypad (probably works fine; haven't tested)

* Accuball trackball controller (probably works fine; I just cleaned the ball)

* Atari SX212 1200bps modem (has both Atari SIO and 25pin PC serial ports)
(I can't find a power adapter for it!)

* Atari 1200XL mother board (looks like it was left outdoors :^(poor guy!
Did not power up when I plugged it in. Either dead, or at the least needs
some love and care. May be good for parts. Not upgraded; includes
RF shield. Labelled: "DA 243 REV. A" on a sticker near the keyboard plug.)

[Remember: This is just the mother board; no case, no keyboard.
I have some power supplies that I think are appropriate for it.]

Thanks!

5832. The "best" Operating System?

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-20 23:28:52 UTC
From: Larry <LLppwhite@aol.com>
Message-ID: <1140478132.692899.233120@g44g2000cwa.googlegroups.com>
Source record: 7638

Of all the OS's written for the A8, which is the best XL/XE OS? (It must recognize the parallel bus.) And which is the best 800-type "compatability" OS used on the XL/XE for older software? And of course -- WHY did you pick your favorites?

My favorite is the the Ultra Speed + OS from CSS. It is "the best" because it works so well with the Black Box and Floppy Board. But even without the BB, it handles UltraSpeed so transparently. It also provides an extremely floppy-like ramdisk if you have expanded ram. 720 sectors, single or DD.

My favorite 800-type OS is Omnimon -- hands down, no contenders -- love that monitor!!! I must admit, however, that especially using a VGA up-converter, Omniview is very impressive. But it's still way behind Omnimon, because there is so little 80-column software.
-Larry

5833. Changing the screen color/luminance on an OS?

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-20 23:33:38 UTC

I'm surprised there were no takers on this but I found a solution to
the no-boot condition, to many of my stability issues.

The SRAM chip that I used for testing is a 32K x 8. Since I was only
testing one ROM image at a time in all of my models I hadn't bothered
to hook up unused address pins. This left them "floating", a very bad
idea (did I say I was a newbie?).

Eventually I had moved on to testing a true external SRAM cartridge for
which I used a selector switch. This is how I discovered what I was
doing wrong.

I hooked the common pin of my selector switch to +5V (Vcc) and the output pins to two address pins (A13 and A14) of my SRAM to give me control of 4 banks, 8K each.

After loading the images I found that selections 0 thru 2 using my switch were unstable but selection 3 was very stable. This is when I realized that my switch was apply +5V to both address pins with selection 3 but any other selection left one or two pins floating!

I've since rewired my switch (to GND) and I now use proper pullup resistors for my address pins. The switch now pulls the address pins LOW when asserted instead of applying +5V and no pins are ever just "floating".

I still have problems.

- My simulated carts (hardware installed inside the 800XL) are more stable than my external cart.

- My substitution for internal BASIC works well EXCEPT most Atari and Activision images don't work. I think the ROM code is actually attempting to disable the internal BASIC ROM which would actually shutdown my SRAM instead. (I'm just guessing that's what's happening).

Most other ROM images work fine.

Source record: 7643

Hello,

I'm an avid 8-bit computer collector and have picked up a couple of Atari 800's on eBay. The first is an original 800, but it did not come with a BASIC cart. The second is an 800XL, but it did not come with a power supply. I have also purchased a 1050 disk drive, but it did not come with any DOS diskettes.

I have a couple of games that were on back sides of C64 software, and they both boot and play fine on the standard 800.

Can anyone recommend a website for getting started in collecting and using this stuff? Where can I get an RS-232 interface and term software? Is there any PC software for writing Atari disks, or for using the 1050 disk drive hooked up to the PC like x1541 cables allow using Commodore disk drives on a PC?

Any and all information is greatly appreciated!

Thanks,

Payton Byrd

> -Larry

Larry,

Until someone with significant experience modifying OSes chimes in I hope this helps.

The default color values for the standard 800XL appear to be at $FB08-$FB0C. Color1 ($709) and Color2 ($710) get loaded from $FB09 and $FB10, respectively. The defaults are $CA (202 dec) and $94 (148 dec), respectively.

I did a quick test in Atari800win Plus 4.0. Changing the default values to $C4 and $9A within the ROM image does produce inversed video in BASIC and DOS. (BTW, the offsets in the ROM image for the above locations are $3B09-$3B0C)

The bad news is, for real hardware you would have to correct the OS checksums (which I do not know how to do correctly). This is not important in Atari800Win Plus because the emulator allows the Checksum to be ignored.

Third party OS ROMs might not use the same locations for the default color tables.

Ho, Payton.
I don't know what you'd want to attach a 1050 to a PC for.
There is such cable and software, called 10502PC or something.
I think it is used to make disk images of copy protected disks.
What's the x1541 used for? I can see maybe direct input to
a C= emulator?
There are a number of places to get the 800XL power supply.
You can do some writing of Atari software using a PC, but are
limited to double density, which a stock 1050 isn't.
You can get APE software for free that, I think the free one,
will allow you to use your serial port on a PC thru a APE
cable connected to the Atari.
There's a lot of Atari8 software on the internet. The APE
cable is a good way to pretty much bypass the 1050 and
just use your PC as a disk drive, with disk images up to 16 megs.
The comp.sys.atari.8bit FAQ is has a lot of answers to beginner's
questions, and the Vendor list is fairly exhaustive.
You can get a combination APE/PRO interface from Steve Tucker

at www.atarimax.com
Since the vendor list is so exhaustive I'll hazard some suggestions:
Video 61, B&C Computervisions, Best Atari, Ben Smith Atari
are still active. Someone here may have a spare XL/XE power
supply.
You can make an interface cable, if you're electronics handy and
have spare SIO and serial cables, I'm sure the directions for
the APE or SIO2PC cables are still available online, in the FAQ.
Good Luck

I can offer a little help.

There is no PC software, AFAIK, that can write Atari single density or enhanced density disks. Has something to do with issues with PC floppy controllers.

Hias Reichl has written a nice utility that can write Double Density floppies, but you would need an XF551 drive or one of the many third party drives system that can read/write double density, like SWP ATR8000, or Track, Rana, Indus, US doubler modified Atari drive.

Today, most people skip using Atari floppies and instead use an SIO2PC cable and one of the Atari drive emulation programs, including APE (Atari Peripheral Emulator, DOS and Windows versions), AtariSIO (Linux), Atari810 (I think that's the name for Windows NT/XP only), SIO2PC (DOS), and more. There are also programs for the MAC and possibly other platforms.

If you have an Atari 8-bit computer, a PC, an SIO2PC cable, and one of the disk emulation programs you write real diskettes, should you still feel the need.

As for connecting an Atari disk drive directly to a PC, you need a different special cable, one of two types, a 1050-2-PC cable or a Pro System cable. To be honest I do not know what software you need to go with this cable except that Atari++ (Atari 8bit emulator) can utilizes such a connection directly.

Seems like nearly all the software ever written for the A8 is available for download, mostly in disk image form, ATR. All the disk emulator programs recognize this format.

Sorry, can't offer much help regarding RS232 interfaces I have had the need for a modem for my Ataris for almost twenty years.

Best Electronics (www.best-electronics-ca.com) seems to be the premier vendor for obtaining genuine Atari hardware but you will need to purchase Best's catalog to get the most from them. They have a search engine but do not have an online catalog or ordering system.

My favorite links for downloading A8 software

Not being very patient or skillful with joystick, but wanting to see
into Jaeger's 'Pinhead', I search for a cheat.
Omnimon, load up Pinhead, press SELECT-RESET, search for
LDA #$05 ($A9 05) ... ah ha! there it is on page 6, $6D0 to be
exact, LDA #$05 STA $82 ($A9 $05 $85 $82).
So modify $6D1 from 05 to, say $20 gives 32 lives. I did a
$FF for 255 lives and played to 460,000, still have 30 lives left.
So, cheat, Modify $6D1 to any number up to 255.
You could also use Disk Wizard II and modify the file itself, if
you could get the offset right, search for bytes $A9 $05 $85 $82,
and once you find it, edit to $A9 $FF $85 $82. I'm pretty
sure the page zero is $82, could be memory wrong (mine not the
Atari.)

How can I tell if my 1050 has been extended for DD? I found an SIO2PC
on ebay and went ahead and bought it. Is that really all I need to load
software directly from my PCs?

What about RS232 interfaces?

Your SIO2PC cable may/probably can be used with your PC and
APE software as a modem cable. I haven't had much luck with
it for that tho. The serial interfaces for direct use with the Atari
are the PRC: connection, the old 850, or possibly, but expensive
Black Box or MIO. People here are talking about a Lantronix
or something to connect their 8-bit with a PC, for internet access.
About the only thing I can think you'd do 8-bit on internet is
a *nix shell account. There aren't many (any?) dial up BBSes.
Most ISP require at least a 9600 baud connection, which is
pushing it for an 8-bit, you'd have to train your modem to
9600. Some people claim 19,200, but I haven't had success with that.
The Atari at 4800 baud is about the limit in my experience.
Ice-T and Bob Term are probably your best term software for
A8s, probably Ice-T.

Oh, how to tell if your 1050 is modified for double density.
Stick a double density disk in it, if it SNARKs and BARFs, it
isn't double density. Probably you have a stock 1050, just a guess.
(When you try to boot or read a DIR).
You're going to need a DOS disk, or two. The SIO2PC cable
and SIO2PC or APE software will allow you to write DOS disks
in your 1050. The main A8 DOSes are Atari DOS 2/2.5, MyDOS 4.53,
and Sparta/FTe DOS 3.2g. SpartaDOS X is a cartridge that will
allow you to format and make bootable a real disk in a 1050 without
anything but the cart.

Well, I'm running a telnet BBS on my Commodore 128 at the telnet address
below. I had a friend many years ago that ran a BBS on his 135xl (??)
that was pretty cool, and with the disk emulator software I may be able
to justify putting up an Atari BBS as well if I can find some software I
like. I would also just like to be able to say that I can put my
Commodores, Apples and Ataris online at the same time and all of them
call my BBS!

Good question. Sounds like you are limited on diskettes at this time.

If you don't actually have a DD density diskette yet nor a DOS diskette
it would be difficult.

- You could open the the 1050 and look for the US doubler ugrade.

- If you still have a PC with a 5.25" drive kicking around you can
download Hias' WriteATR and copy a DD ATR (disk image) to a real
diskette. You could then test it in the 1050. Probably not worth the
effort.

- Wait until you get you SIO2PC cable and then attempt to format a DD
diskette on the 1050

>
> What about RS232 interfaces?

Can't think of any low-cost units except R-Verter . You can even make
one from an SIO2PC cable with a few parts.

I've got a link (if I can find it... Sorry, it will have to be
tomorrow).

Are there any BBSes to dial into, though? 1995, or thereabouts, was
the last time I connected to any BBS and that was with a PC.

Yup, just point your Hyperterminal at paytonbyrd.dyndns.org:6400, or even better, get CG Term at <http://www.paradroid.net/cgterm/> and use it to call paytonbyrd.dyndns.org:6400.

Hi Steve-

> Until someone with significant experience modifying OSes chimes in I hope this helps.

The default color values for the standard 800XL appear to be at $FB08-$FB0C. Color1 ($709) and Color2 ($710) get loaded from $FB09 and $FB10, respectively. The defaults are $CA (202 dec) and $94 (148 dec),

respectively. < (snip...)

Thanks much, Steve -- I'll start snooping around these values. Yes, those checksums could be tricky.

Hello Payton-
Congrats on your purchases! I skimmed through the posts here, but did
not see one suggesting that you download and read the FAQ's. We are
very fortunate to have some very nice FAQ's.

http://www.faqs.org/faqs/atari-8-bit/welcome/
This is a concise index of some interesting aspects of Atari 8-bits.

http://www.faqs.org/faqs/atari-8-bit/faq/
This is the link to the main FAQ's. There is a lot there, but well
organized and easy to find topics of specific interest. In particular,
check out section 10.

Good luck,
-Larry

I need to find my little black book from way back when I modified a lot of atari game for unlimited etc.

For pinhead though I'd rather see a cheat where if you miss the balloon just falls through the playfield and you keep playing..... or at least get rid of the loud death dirge.

-Didn't at least one of those company's say that they wouldn't produce
-anymore Atari 8-bit titles due to rampant piracy in the Atari
community?

Definately a problem then, but in a way it was worse for C-64 and A2
people since software alone would copy the disks. Maybe it was because
you had to buy hardware copiers for the atari that so many more titles
were cracked to no protection and distributed via BBS vs. copy parties
or mail trades.....

It wouldn't be too hard to fix for unlimited lives. The number of lives is kept at B2. So, you could search for a DEC $B2 and change to NOP NOP, maybe. Anyway 255 lives gives you over an hour of play, plenty long enough to get a score of 500,000 and be able to see what 'Pinhead' has. After about 125,000 it just repeats, with no new stuff happening.
I thought some people might want to modify it themselves.

I bought an SIO2PC interface for mine from Steven Tucker and he is a
great guy. I didn't have the disk drive cable so he sent me a different
cable that didn't need it.

You can pretty much do anything you want without the disk drive itself-
it's not needed unless you are trying to copy real disks.

Larry:

> Yes,
> those checksums could be tricky.

If you changing anything in ROM just calculate new chksums
and change it too - cause not only emulators can check it
so more safe is to have them correct. Procedures for checking
ROM does it - vector E4something ;) - I don't remember now,
but it's not necessery to look - its just plain sums of all cells
in particular ROM regions (no CRC or this kind of stuff) :).
One thing to check is what cells are not in sums.
As I can remember it's probably C000-C001 and FFF8-FFF9,
but make sure that's true yourself :).

I think EA was another that gave the piracy reason for not supporting Atari.
I do know that there were a LOT more pirate copy programs/hardware mods for
C-64 users back then, but Atari piracy seemed to get more of the headlines -
esp with cases like Lucasfilm's games being pirated/distributed directly
from Atari :/

It was probably because the C64 as a computer sold much better than the A8 (later on anyway), thus Epyx and such were still able to make their share with what they sold for the C64, though the Commodore versions were copied as heavily.

And I think the Atari versions weren't just selling that well.

Sad, but true.

Frank

Probably the reason why they stopped making software for the Atari is
the same reason a lot of companies stopped making software for the
Nintendo 64 when the Play Station came out. On the C64 for the
majority, if you wanted to play any game software you needed a disk
drive, for the Atari you could play lots of games that were cartridge
based and never need a disk drive. So if they made games for the Atari
they would need to either make them cartridge based, or disk based. If
they were disk based people how had no need for the drive woul have to
buy them to play it. It is cheaper for a company to make disk based
games than cartridge based games. The same happened with the N64 and
the PS, cheaper to make CD's for the PS than cartridges for the N64.

I don't know...same thing could be said about the Amiga under Commordore.

I also believe, IMHO, that the Atari 16 bit line was significant at the
time.

You didn't have an option with the N64- you had to use carts. Not so with the Atari computers. There were only about 200 carts made for them(including the later XEGS releases), compared to the few thousand titles made on disk. Not many companies were making cart-based software by the early 80s b/c it was much cheaper/faster to produce disk-based software. Companies only abandon platforms if there's no money to be made. They abandoned the Atari 8-bits b/c people weren't buying enough copies of games, and the reason most gave was that it was due to piracy.

That's certainly true for the US market and/or the early 80s.

Europe, and Germany where I come from, had always been more
cassette-oriented. I don't remember seeing that many cartridges in the
shops. Even disk-based games were not too common, and mostly only available
from mailorder services specialised in Atari software. Most shops, even the
big stores, were stocking cassettes, if any A8 games, at least from '85
onwards.

I guess the same holds true for the UK and, later on, the eastern European
countries.

As for the hardware's capabilities, that's clearly not the reason why so
many Atarians missed out games like Summer Games II et al. Just have a look
at the huge amount of software ported to the Spectrum, a good, but
technically inferior machine.

No, I still think it comes down to Atari having not been able to find enough
takes for their A8 line. The C64 (and the Speccy, that is) sold many more
units, thus justifying even the oddest port. There were just too few Atari
out to make ends meet.

Back when I was fooling with OS code I found it easiest to just disable the checksum. I can't remember how/where I did it, just a couple of NOPs or something in the checksum code. I'm pretty sure at least one of the Wooley hacks includes a where and how to that he used for his modified OS.

I didn't have any trouble with 9600 using an 850 with my 130XE and
Bobterm back in the day. I haven't used it online, though, since Delphi
dropped dialup service. My current ISP has a 14,400 bps minimum.

Well, isn't that interesting...Despite what it says on my ISP's website,
I just managed to connect with my Linux PC at 2400 bps, and I'm here now
downloading and uploading posts. Working fine, although it sure seems
slow compared to the 56K speed I'm used to. I'll have to rethink the
possibilities of going online with my 8-bit again...

I must say I'm very impressed with the attention to detail put forward
in the Atari 8-bit FAQs compared to the FAQs for Commodore 8-bit
machines. Even though there's a TON of information in the Commodore
8-bit FAQs, the FAQs just doesn't feel very approachable.

IMO, the failure of both companies is directly tied to Irving Gould and
Jack Tramiel. Why Irving Gould and Atari? Because the act of firing
Jack Tramiel killed both companies because Jack at Atari was too
possessed with outdoing Commodore instead of focusing on product, but
Jack was Commodore's rudder and was the perfect fit for managing their
engineers. I don't think Jack fit the culture of Atari and Commodore
was just adrift without him.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Thats a very interesting point as well. I mean for sure, that was a
defining moment for both companies!

Anyone know what happened to www.emulators.com/xformer.htm ???

This site had good info on using a Xformer Cable on a PC if I remember correctly.

I was doing research on something similar awhile back. Not sure if I saved the Web info
from this site or not.

Reason I ask about it: This site showed you how to alter the normal Xformer Cable to work
on a PC. It was easy to do, only a wire or two needed changed.
Anyone happen to know how to do it or have a text file on modifying it?

Hopefully, it will come back up later.

Hi guys

Just to let you know we've posted our first effort on porting the excelent New Rally X game by Namco to the Atari 8bit. This demo is in a very early developement stage, but it's a start.

Here are some links to the screenshots and the Atari executable you can play on your favorite emulator, or even on your real Atari!

http://img.photobucket.com/albums/v688/monitorero/nrx02.png

http://img.photobucket.com/albums/v688/monitorero/nrx01.png

http://www.atariware.cl/foro/download.php?id=158

If you read spanish, you can read the feedback here:

http://www.atariware.cl/foro/viewtopic.php?p=4534

...and if you read english, you can read the feedback there:

http://www.atariage.com/forums/index.php?showtopic=83947

>there are many piracy in the Commodore community too. I am confused!

With a smaller market, piracy takes a larger bite out of your potential
profit. The C64 market was huge in the later days...

Does anyone have the scoop on this? I recall reading somewhere that the
head guy at one of these company's went on record as to why they weren't
selling Atari 8-bit software anymore.

You can just kill the code that does the checksum check.

Here's an example from some of Bob Wooley's SmartIDE code:

```
0250 *=$C31D KILL ROM CHKSUM
0260 NOP
0270 NOP
```

I tried just CLC, RTS at $FF73 and $FF92, the checksum verify routines,
but that didn't completely work.

Kind of strange, for Atari800Win Plus it worked but in my 800XL it only
partially worked. By that I mean, if I install a game cartridge all is
fine but if I try to boot with no cartridge or with a programming
cartridge (BASIC, ASM ED, etc) the 800XL just boots to a blank desktop
with the block cursor in the upper left-hand corner. No disk I/O and
no sounds.

I'd like to try NOPs but I don't understand why a simple CLC and RTS
didn't work so I'm also not sure what instructions are safe to replace
with NOPs.

Atari lovers should disdain Irving Gould as much as us Commodore nuts.

I don't seem to have access to the Commodore newsgroup. And I am first and foremost an Atari user. However I have this C128 sitting here and was wanting to experiement with it as I never had one in the 'day'. Does anyone have a 1571 disk drive they would be willing to sell? TIA

Thomas

There's tons of them on eBay. You should be able to snag one under $35.
If you can settle for a 1541 those can be had for under $10. A 1581
will typically run about $75+.

I have extra 1541's if you need one. I'll take $10 + packing +
shipping. I am out of spare 1571 and 1581 drives currently. I also
have a ton of software if you're interested.

What do you mean by this? Does your news server not carry comp.sys.cbm?
How about alt.c64?

Memory is to foggy now but I seem to recall the checksum code I hacked
did just a bit more then the checksum. That is it does the checksum and
initializes some other values.

Anyway, Shawn just posted the spot for the XL OS to NOP. I do recall the
code is identical in the 800/400 OS, just in a different location, so
you can just search for the byte sequence to find it.

Bill Wilkinson said it but then went on to add the problem at OSS was
~more about choosing a platform to develop programming languages for
where fewer then 2% of the owners programmed. He also said it was
actually a Mac project that put OSS out of business vs. Atari.

I *think* the one most noted for the statement was probably someone like
Trip Hawkins at EA. The bean counters figured ~fixed cost for product
development and marketing with net return per unit sale => 'we must sell
xxx copies to turn a profit.'

FWIW we did the same calculations in the pharmaceutical industry. Didn't
matter if you could save lives or relieve suffering, just how big was
the market.

User error! LOL

I had two copies of the patched 800XL dump. Wouldn't you know it, I
installed the wrong one on the real 800XL.

Sorry, for the mistake!

CLC & RTS work perfectly, at locations $FF73 (VFR, Verify First ROM)
and $FF92 (VSR, Verify Second ROM).

Now I can change the OS all I want and not worry about failed
Checksums!

So far, I've only changed the Color1 and Color2 default and set the
left margin to 0 (versus 2). Unfortunately, MyDOS' DUP.SYS changes it
back to 2!

OT: Does anyone know how to patch MyDOS?

- Steve Sheppard

5893. DGS Atari 8-bit CD-ROM $5 special (until 03 March 2006)

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-25 00:11:04 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1140826261.28210.0@echo.uk.clara.net>
Source record: 7550

Hello All,

This week (until 3 March 2006) I will be offering the DGS Atari 8-bit CD-ROM (commercial and PD combo) for the special price of $5 (2pounds for UK buyers), which is a $3.50 saving on the usual price. This price includes SURFACE MAIL shipping to any country (2nd class post for UK buyers). This offer is for those of you who want to save some money, but don't mind waiting as surface mail can take 60+ days!

If you don't already know, the CD contains most of the DGS commercial Atari 8-bit products and the full DGS PD library (191 double sided disks). The commercial products include the PPP products QUICK programming language, SAM 80-col GUI (no extra hardware required), and games, along with the Digi-Studio digitized music package, all 26 issues of the DGS newsletter, and more. All products are in both DCM and ATR format, and have PDF versions of the manuals. A copy of the video we shot at the 1996 AMS show is also on the CD in MPEG-1 format. Full details with descriptions and screen shots are available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8-su.htm

Payment is by PayPal only, and there are payment buttons on the page. If you prefer, you can PayPal the money directly to me if you don't like using direct payment links.

There's plenty of background info on DGS on the main part of the website.

Dean Garraghty

Me again eating crow.. again!
```

Although everything seemed fine, one of my changes above has corrupted
the Self Test! Don't know what else might be affected.

I'm going to shut up now and let some who knows what they are doing
speak about changing the OS.

Mmm.... I seem to remember a basic program that you could run and it would ask you what colors you would like and give you the option to turn off the disk sound. The program would then create a little autorun.sys that would poke those values on boot up. It doesn't change the OS, so you don't have it all the time, but back in the day it worked just dandy for me.

I remember using it a lot to automatically set the left margin to 0, turn off the drive sound, and set a darker blue for the background.

I wish I could remember the name of the program...

To kill the beeps, POKE 65,0. Poke any other number there to be annoyed once
more.

Simple as that. Or, if you like... even if you don't know jack about
assembly, you can use nearly any assembler to make a custom autorun.sys or
.AR0-9 file to do this for you.

An example would be something like...

```
10 *=65
20 .BYTE 0
```

And then just assemble it to a file. With the Atari Assembler cart, or
Mac/65, it'd be ASM,,#D:AUTORUN.SYS if you have the source code in memory,
or ASM#D:filename,,#D:AUTORUN.SYS if it's stored on disk.

You can repeat that string as many times as you like.

```
10 *=65
20 .BYTE 0
30 *=82
40 .BYTE 0
```

This routine will kill the I/O beep and set the left screen margin to 0
instead of 2 spaces.

I have a disk based assembler I could send to you in atr format, if you
like.

5901. Trak drive repair.

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-25 16:04:45 UTC
From: Rory McMahon <rorymcmahonNOSPAM@yahoo.com>
Message-ID: <jnv00255vqn3roqisljf4omqiugijqc86q@4ax.com>
Source record: 7558

Hi all,

Does anyone repair these drives? I have one that needs some repair.
The drive powers up, but cannot be accessed. The drive keeps switching
between single and double density. Doesn't seem to find the first
sector. When setup as drive 2, and I try to do a disk directory, it
knows to go to track 20, so I think it may be a matter of alignment
and possibly a speed check. afaik,I dont think the drive is in
diagnostic mode.

Any help would be appreciated.

Thanks
Rory McMahon

I found the source of my confusion, and why a simple change had such disasterous results.

My mistake was I used the monitor feature of Atari800Win Plus to do make my ROM dump, after implementing the changes in the OS, also from within the monitor.

I did my testing within the emulator by using the monitor RAM command which allows one to make changes to the any part of the emulated Atari on-the-fly. Making it possible to perform quick tests as the Atari800Win Plus will hold the changes throuh a Cold Start.

I assumed that the monitor command, Write C000 FFFF, would give me a good ROM dump. It didn't.

Everything went smoothly when I used a hex editor. The patched image works fine.

The planet size and position seems to be randomly generated. Press the
reset switch and you'll see it's different every time.

OK, I've gotten my SIO2PC and the trial version of APE. All has gone well so far. Where do you guys suggest I find a good library of disk images?

I'm somewhat interested in games, but more stuff like operating systems, programming languages, terminals, etc. I also want to check out demos for the Atari.

Aside from that, the landing pad colors are different and the actual version
doesn't say "PRESS TRIGGER TO CONTINUE" on that screen.

5911. PBI2PC

Newsgroup: comp.sys.atari.8bit
Date: 2006-02-27 23:14:46 UTC
From: Preston Crow <pc-usenet05@crowcastle.net>
Message-ID: <pan.2006.02.27.23.14.45.803687@crowcastle.net>
Source record: 7568

I'm reading the articles on using the PBI interface at
http://www.geocities.com/dr_seppel/pbi3_eng.htm
and it looks like it should be possible to build a PBI device that works
much like an SIO2PC device, only much faster.

I'm thinking that the ideal design would connect the PBI interface to a
USB port on a PC, and use minimal circuitry. I've never build a USB
device before, but I assume that there are relatively inexpensive
controller chips that would work. A little bit of additional logic and
probably some RAM would also be required.

Anyone want to work on this with me? (In person if you're in the Boston
area.)

Source record: 7569

http://www.crowcastle.net/preston/atari/

"Disk" version 4.0

It started as a simple sector editor, but I've added all sorts of features
to it along the way. Slower code was re-written in assembly. Features
were added.

The 4.0 release includes bug fixes and some new features.

I would very much appreciate any feedback.

And I'm hoping to add double density support at some point in the future,
once I obtain a drive that supports it.

erm..

the most worse I know, is Irving Gould and and not to forget: Mehdi Ali

Tramiel and Tramiel and.... etc.. have done a big contribution. Space Shuttle, Mike Oldfield, just to name a few successors/user with Atari Hardware.

Jack Tramiel left the 8bit market, and he also made some extra-money with the XE, GS etc.. -series. But the ST/TT and Falcon series is extra-class.

Kind Regards,

Daniel Mandic

The interesting thing about Amiga is that if it weren't for Jack, it
would have been an Atari product, which is where it would have been more
successful because the Amiga's architecture was more similar to the
Atari 8-bit line, where the ST's architecture was closer to the C64
line. Commodore had the chip resources (MOS Tech) to make the ST's
architecture even more interesting than it was and it also had the
people to parlay a smooth transition to the ST from the 64/128 line.

I think this story can be expanded in many directions. I like the way,
Miner and Haynie. The tribble A Chipset, and so. AGA, ECS as well.

It was many future-music at that time. The way of the Tramiels is
honourable, as well the way of [Gouldï¿½s] Team, Haynie, Fischer,
Augenbraun, Nesbitt and many many other people.

Maybe the managers paid too much attention to the IBM-PC Market. But
they should release the AAA-Amiga. ermm.. as a penalty :)

Best Regards,

Daniel Mandic

I recently found out that there's only 32 levels on the Parker Bros version, after which it resets back to 1. The First Star version's manual mentions 34 levels (the P.B. manual doesn't mention how many there are)

There's also 7 different animation sequences (every 4th level). The first shows you returning to no reception, the 2nd a crowd is present, the 3rd shows a car pulling up with you getting in it, the 4th has 6 solders following the car, the 5th has 12 solders, the 6th adds 3 dogs, the 7th has the car pull away just before you get in, and shows you chasing after the procession, the 8th is a repeat of the 7th.

I can't think of anything positive that Gould brought to the table after
bailing Jack out of the big financial scandal in the 60s. After that,
he was solely in it to fund his playboy lifestyle and he didn't care who
or what was destroyed in the process.

Hi Preston,

While I think a PBI device and USB are both a good idea I don't think
you will be able to get as huge a performance increase as you might
imagine in real world applications. It comes down to the Atari only
effectively being able to do ~.1 MIPs so you can only do ~24k load, inc,
store, branch, operations a second. Figure at ~57k BAUD the serial buss
is already doing ~7k.

I guess if you are willing to do DMA you could make it quite a bit
faster but that would be a much more involved design.

I've seen some of the USB on a chip designs, I think Rabbit is one of
them: Souped up 8049 type micro doing the work. It might be easier to
map it into the Atari hardware registers at $D000-$D7FFF. IIRC The page
wide decoding is already done and mostly open at $D600-$D7FFF.

5923. Update: Electric Cafe'

Ok the BBS is back up. I have replaced the power supply and all is well.
While I had the computer at the house I reworked my soldering handywork from
15 years ago and it seems to run fine.

Telnet: thecafe.dtdns.net / use port 8888

Thomas

Usually, you can get in, but putting them back together may be
troublesome, since they don't all seem to have plugs over the screw holes.
Some appear to be glued together.

Mind you, gaffer tape works wonders. :-)

Another difference between the original First Star version and the Parker Bros and the Max-A-Flex versions is the stars on the main screen are yellow in the original (same with the shield depots and energy generators); in the others they are all purple. A side note: On Earth, the stars are normally blue, except when the ship is taking off (purple) or landing (pink); they match the color outline of the ships rocket fire.

Yeah. Despite it's name, I learned a long time ago that Duct Tape SUCKS for taping up ventilation ducts. In the case of Air Conditioning ducts, when there is high humidity, condensation forms on the ducts and, after a while, basically turns the adhesive to dust.

Another bit of useless information brought to you by...

I remember hearing once that developers/publishers had multi-year
contracts with Commodore, and hence had to stick around even after the
8-bit market was no longer viable.

I have no idea where I heard it, and it doesn't really sound plausible,
so take it with a grain of salt. ;^)

I don't think publishers did exclusive contract like this back then like
they do now, so that's probably just a rumor. I believe the Atari
market was just much smaller than the C64 and Apple market and they had
to drop one of them.

The 64 was $100-150 less than the Atari when sold head-to-head in Sears,
and 64's were in K-Mart, so they basically took over. Atari had a
really nice product that was definately ahead of it's time in 1979,
although that came at a price. Not many people could afford to drop
$1500 on a 400/800, RAM, and an 810 drive. Commodore had nothing to
compete with that for 3 years, but came in at a very cheap price and got
a lot of kids right when the console market crashed in 83.

"IMO" :)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

5948. Re: Question about TBXL

Newsgroup: comp.sys.atari.8bit
Date: 2006-03-02 12:00:57 UTC
From: Larry <LLppwhite@aol.com>
Message-ID: <1141300857.801881.132830@i40g2000cwc.googlegroups.com>
Source record: 7505

A short update... I recently bought the cartridge version of TBXL from Video 61. It works very well, containing both the Interpreter and Compiler with a boot-up menu to choose between them. AND, using the "Run at Address" function of MyDos at $2080, I've been able to get back to my TB programs *intact* from the DUP.SYS menu, so long as I have not copied or otherwise disturbed the program memory area. Cool! The only thing I've found that doesn't work properly is if you have chosen a subdirectory while in DUP.SYS, MyDos "forgets" the subdirectory and you are back to Dx:. But this is exactly like pressing RESET, where the Warm Start also causes MyDos forget the subdirectory.
-Larry

I would have guessed at the, except for the failure to understand the term
gaffer tape, since it's used widely (the term, as well as the tape) in the
American film industry. After all, that's how it got the name gaffer tape
in the first place. At least, so I'm lead to believe.

Ken,
Do you know the checksum mumers : for the cartridge. I have a dump called
TEST ATARI 65-130XE R.2.ROM and probably not what you are looking for. A
couple of years ago I ran a program called RomCenter against my directory of
Roms and other files and changed all the names, but with the checksum # i
could scan my file to see if I have your request...

5953. DGS Atari 8-bit CD-ROM $5 special (until 03 March 2006)

Newsgroup: comp.sys.atari.8bit
Date: 2006-03-02 19:15:55 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1141326953.92628.0@doris.uk.clara.net>
Source record: 7510

Hello All,

Just a quick reminder about the CD-ROM offer. Still a couple of days left!

This week (until 3 March 2006) I will be offering the DGS Atari 8-bit CD-ROM (commercial and PD combo) for the special price of $5 (2pounds for UK buyers), which is a $3.50 saving on the usual price. This price includes SURFACE MAIL shipping to any country (2nd class post for UK buyers). This offer is for those of you who want to save some money, but don't mind waiting as surface mail can take 60+ days!

If you don't already know, the CD contains most of the DGS commercial Atari 8-bit products and the full DGS PD library (191 double sided disks). The commercial products include the PPP products QUICK programming language, SAM 80-col GUI (no extra hardware required), and games, along with the Digi-Studio digitized music package, all 26 issues of the DGS newsletter, and more. All products are in both DCM and ATR format, and have PDF versions of the manuals. A copy of the video we shot at the 1996 AMS show is also on the CD in MPEG-1 format. Full details with descriptions and screen shots are available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8-su.htm

Payment is by PayPal only, and there are payment buttons on the page. If you prefer, you can PayPal the money directly to me if you don't like using direct payment links.

There's plenty of background info on DGS on the main part of the website.

Dean Garraghty

comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic,rec.games.video.marketplace,pdx.forsale

This March I'm celebrating my Birthday! If you want to bless me, I'm
trying to raise Capital to buyout an Atari Dealer of all his Atari goods!
So give me your Atari business, send all Atarians Marching my way and help
save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled
from all items NEW in BOX from all my other catalogs made up of Hardware,
Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns
of text width it will be 80 column width, Most entries will be 1 line each
and sorted alphabetically by title. You'll only find my NEW items in this
catalog as I'm removing such NEW item's from their other catalogs.

http://BensCatalogs.Atari.org Atari's for sale!
http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!
http://www.aracnet.com/~atari/birthday.htm Ben's Atari Birthday!
http://www.aracnet.com/~atari/wantlist.htm What Ben Wants!

I've got a fast turnaround rate. Usually, Once I receive payment your
order goes out the same day. Customers love the speedy service! I have
lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or
Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at
http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

> for the Atari.

The old Umich archive (no longer maintained, since they closed my account
since I wasn't a Umich student/staff/faculty >:^P) is probably still a
a pretty good starting point:

http://www.umich.edu/~archive/atari/8bit/

Most of it was from a time before emulators and when SIO2PC was still new
and novel, so it's not just a ton of ATR disk images in ZIP format. It's
actually stuff you'd use directly on an Atari. :^)

XL Search is my search engine that lets you dig around the various
Atari 8-bit FTP sites:

http://xlsearch.atari.org/

Good luck!

I already provided my best gaming links. The Umich.edu site also has
demos, programmers tools, every DOS imaginable, but has Bill Kendrick
mentioned, it's not up-to-date.

Can't remember if this is a mirror of the Umich site, vice versa, or
something completely different. In any case, huge collections here.

http://ftp.atari.art.pl/stuff/

For programming info you definitely want to visit Carsten Strottman's
page.

http://www.strotmann.de/twiki/bin/view/APG/

Need access to old Atari magazine articles? Try here.

http://www.atariarchives.org/

The SPACE newsletters are quite interesting.

http://space.atari.org/

There's many more sites. I just can't seem to remember them. (I
really have to organize my bookmarks).

5967. 4 paddles on a 600xl/800xl

Newsgroup: comp.sys.atari.8bit
Date: 2006-03-04 01:43:56 UTC
From: momo <momo@nono.com>
Message-ID: <wh6Of.2803$Rm2.1202@newssvr31.news.prodigy.com>
Source record: 7523

Working on a project where I need a total of 8 paddle inputs on either a 600xl or an 800xl with only 2 joystick ports. I really dont want to use my 800 for this so I need to stick with the xl's. I was wondering are the pinouts inside buried somewhere? Does the XL ROM even support all 8? TIA
Mo

As I remember it there are only 2 paddle inputs per joystick port. To get 8
paddles you have to have 4 joystick ports.

Well, I think what momo was looking for was a way to get 2 more controller
ports on an XL. Not sure it's possible. I thought those bits were being
used for controlling RAM-under-OS-ROM, or something.

blush Yeah, >I< know what I'm talking about. 8^&

All,

I'm in the middle of changing the direction of my classic computer related BBS, as a result I've been releasing my (rather extensive) file collection as a group of bittorrents. Just recently finished my Commodore stuff & have now put up my Atari 8 bit collections (2600, 5200, 7800 & 800XL).

The tracker is at http://landover.no-ip.com/tt

Help yourselves & spread 'em around.

regs,

Lance

Sure they are. The inputs are available on the Pokey chip.

> Does the XL ROM even support all 8?

No. Which means that you cannot use the shadow registers to obtain the
paddle values. You would need to read them from pokey yourself, which
is however only a minor inconvenience.

So long,
Thomas

5974. XIO in C

Newsgroup: comp.sys.atari.8bit

So I'm _finally_ toying with CC65 (to cross-compile on Linux to Atari 8-bit),
and am having a tough time figuring out how to do XIO calls (e.g., "DRAWTO"
or "FILL" graphics, or disk-related stuff).

I'm new at this. (Plus it's late ;^)) Anyone got any examples?

Thx!

Hi Bill!

An XIO command is just a call to CIO. So you would fill an IOCB and do a
call to CIO just like in assembler (I don't think there are any cio
functions in the Atari library for cc65.)

You can do this a couple of ways:

1. Include an assembly .s file in your project and just call it from your C
program.

2. Use in-line assembly in your C code.

3. Write the function in C.

I'll try and post some example code a little later.

Disk related stuff is pretty easy to do via other built-in functions
(fread/fwrite for instance and dio.h for sector level read/write.)

> pinouts inside buried somewhere? Does the XL ROM even support all 8?

Not easy, but possible.

It would have been nice if the XL line had used a 20-bit address space
with a new bank controller, allowing the ROM and RAM to be dynamically
mapped. Alas, they took the cheap route and used the existing Pokey chip
to handle controlling RAM and ROM, using the inputs used by the second
pair of controller jacks.

So at first glance, it's not possible.

But in truth, it's just not easy.

First, each controller has five digital inputs (four joystick directions
and a button) and two analog inputs (the paddles). The analog inputs
measure the resistance to get a value. So this leaves open a good
question: Did they actually hijack all of those inputs in Pokey in the XL
line? Perhaps the analog inputs still work, and you would just need to
solder in another pair of ports. Someone else here might know more about
this.

Second, you could add as many additional ports if you want to build a PBI
device with a controller chip. It could copy the port values during VBI
to be compatible with the 400/800 for the second two ports.

Easiest way to get them to read automatically would be to run something
like FixXL to put the older OS in place.

There was an article in ~ANALOG by Les Brilliant about using Coco or Apple controllers with an Atari. He detailed the operation of the paddle controller circuitry and gave values for caps and resistors. Not quite a must read but not a bad idea either.

Cough, cough. Pokey's not the problem - its paddle inputs are still
open and ready for use. The bank switching logic is actually in PIA
which is responsible for the digital joystick input.

> So at first glance, it's not possible.

Sure it is. As long as we're talking about the paddes.

> So this leaves open a good
> question: Did they actually hijack all of those inputs in Pokey in the XL
> line?

As far as pokey is concerned, none of them. As far as PIA is concerned,
only bits 0,1 and 7 are used, but that makes both the lower and the
upper nibble unavailable for digital joystick input.

> Perhaps the analog inputs still work, and you would just need to
> solder in another pair of ports.

Yes.

So long,
Thomas

Nitpicking: The analog input is not a problem, but the triggers on the
paddles are connected to the joystick inputs, IIRC the left/right pins.

So full support for 8 paddles (including their triggers) isn't doable
on the XL/XE.

so long,

Hias

I'm working my way up to selling one of my old XL systems on eBay. I thought I might enhance the offer by including copies of old 8-bit software, copies that I actually make with the system to demonstrate it works.

Games, of course, would probably be the most popular. I wouldn't include any copies of commercial software, of course, but I have several games that I originally laboriously typed in from the pages of Antic, Compute!, and Analog - a sort of personal "best-of" collection. Since many of those programs are now freely downloadable from atarimagazines.com, and thus easily available to anybody, would it be a problem if I were to include some of them in the mix?

TJ

That's not a problem with me, as long as you're selling the computer,
not the software. As a free bonus, including some software from
AtariMagazines.com sounds like a good idea.

Thanks all, interesting topic but the project Im working on is already very involved without doing a hardware/OS research project along with it. I thought it would be as simple as connecting two more ports to a few pins on pokey and having at it. I think what i'll do is preserve my XL's and ebay for a beatup 400. The keyboard on the 400 would be better for my use anyways being as how most of the work will be outdoors. Thanks again for all the info.

bill@newbreedsoftware.com (William Kendrick):
>Shawn Jefferson <sjeffersonTAKETHISOUTTOREPLY@shaw.ca> wrote:

>> 3. Write the function in C.
>
>I was hoping for #3, personally. ;^)

As promised:

```
#include <atari.h>
#include <conio.h>
#include <string.h>

char buf[256];
char dev[] = {"K:"};

#define iocb1 (*(struct __iocb *) 0x350) // IOCB1

unsigned char main(void)
{
iocb1.command = 0x03;
iocb1.buffer = &dev;
iocb1.aux1 = 0x04;
iocb1.aux2 = 0;
asm("ldx #16");
asm("JSR $E456");

iocb1.command = 0x05;
iocb1.buffer = &buf;
iocb1.buflen = 40;
asm("ldx #16");
asm("JSR $E456");

cprintf("You entered: %s\n\r", buf);
cgetc();
}
```

This code's pretty quick and dirty. Basically I am opening a channel to
the K: device and getting a line of data from the keyboard, and then
printing it out via conio. Probably there is a better way to use CIO from
C, but this is what I would do. I'd probably write a function I could call
from other parts of my program.

The #define at the top defines the label iocb1 to be the memory location of
IOCB1, and the __iocb struct is defined in atari.h.

Hope that helps.

PS: I've never had a need to call CIO directly, since most disk related
stuff can be done other ways, and for graphics, I think it's better to
write directly to graphics memory.

Interesting thought, but unfortunately I threw the magazines away years
ago. Well, all but the copies where my own article appeared. I hadn't
looked at them in four years, and they were taking up valuable space.

I didn't type them in because it was "fun." At first it was because I
was using a <shudder> cassette system. Later, when I finally got my
first 1050, I was too cheap to get a disk subscription!

Well, for the quick-and-dirty, I thought I'd take advantage of the OS's
draw routines. :)

But yeah, it'd be good to actually go through and write some line
drawing routines, and see if I can get 'em going faster than the OS ones. :^)

Awhile back I started writing a graphics library in C for cc65. I posted
what I had to Atariage. It would be nice if we had a good general graphics
library for the Atari platform in cc65.

There is a standard TGI library for cc65 that is cross-platform and the
Atari platform still needs an implementation. (in case you are looking for
something to do with cc65. ;)

I haven't seen any 1mb simm upgrades for the 800, but there are several for
the XL/XE computers floating around on the net: Mathy Nisselroy's, Bob
Woolley's and the Satantronic one, off the top of my head. All these use
the XL method of banking memory into $4000-7FFF controlled by $D301.

Search for PIO2PC. It's like SIO2PC, but uses the PBI. Only bad thing
about it is, that the code from the device isn't switched in nicely, but
simply replaces the OS.

CU Mathy

PS check out my site. PIO2PC is on it.

Looks like I'm a little late.

I'm not sure EPROMs can be adapted so this easily but I'm using an SRAM
in place of the BASIC ROM.

The one major difference in the pin configuration was that A12 for the
BASIC ROM occurs where CS normally would be. I just lifted that pin and
pulled A12 from the OS chip.

Oops, brain cramp!

I forgot, A0 thru A7 are reverse ordered on the BASIC ROM vs an EPROM.

This is not a problem using an SRAM but an EPROM definitely would not
work.

6010. Supra Corp 300 baud modem Smart Terminal software

Real foggy yet again.

If that is the modem that plugs into the joystick port, practically no one used Smart Terminal with it. If you want it as a collector fine.

I think most people used a version of Express written for the Supra or with a separate J/S R:handler. There was something wrong with Smart Term, like it was sold as allowing U/L and D/L but didn't really have a compatible protocol built in. I think even HomePak could be made to work with the Supra.

If you pick up one of the J/S R:handlers from umich you can even use some of the old BASIC terminal programs. I think one even allowed 450 BAUD from either the Supra or Volksmodem but you needed something on the other end that would accept that BAUD rate. Pretty standard implementation of the handlers, just rename them AUTORUN.SYS on a boot disk.

Once you get the correct R: handler, you can
use a number of term programs.
MPP was the 300 baud modem that connected to the joystick port.
You will have trouble connecting to any service though, none support under
about 9600 baud.
Like Rick said, it is probably best to name the
handler AUTORUN.SYS so that the handler gets installed properly.
What you trying to do with the modem? Have you gotten the correct R:
handler? (I forget
the Atari 300 baud modem number, but it used a T: handler.)

6016. Soft and Hard Reset for the 800?

Newsgroup: comp.sys.atari.8bit
Date: 2006-03-08 23:37:03 UTC
From: stephensheppard@hotmail.com
Message-ID: <1141861023.456486.48570@e56g2000cwe.googlegroups.com>
Source record: 7373

How can I reconfigure the 800's System Reset to work more like the Reset on the 800XL? As it stands now this function just hangs the 800 most times that a Reset would be desired. Both the 800 and 800XL initiate a Warm Boot when Reset is pressed but it works better (i.e. more reliably) on the 800XL.

Second question, is there a way to design a Hard Reset that doesn't interupt main power.

The reason I ask is I occasionally have need to connect the 800 to a very old television via the RF cable. When main power is interupted loud static is heard on the television. It's very annoying. I'd like to be able to perform a Reset without listening to that noise.

Could I just interupt Vcc to the CPU? or to CPU + Antic? Would either of these work and would they prevent the static noise?

- Steve Sheppard

I believe Reset just generates a NMI on the 800, it does not actually
reset the cpu.

On the XL/XE the reset key pulls the /RESET pin of the CPU low while
it is pressed. You can use a normally open pushbutton, connecting one side
to the CPU /RESET pin and one side to ground.

I believe /RESET is pin 40 on the normal 6502.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

This March I'm celebrating my Birthday! If you want to bless me, I'm
trying to raise Capital to buyout an Atari Dealer of all his Atari goods!
So give me your Atari business, send all Atarians Marching my way and help
save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled
from all items NEW in BOX from all my other catalogs made up of Hardware,
Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns
of text width it will be 80 column width, Most entries will be 1 line each
and sorted alphabetically by title. You'll only find my NEW items in this
catalog as I'm removing such NEW item's from their other catalogs.

The XL/XE uses a "magic number" sequence of 3 bytes in RAM which it checks during the reset code. Using this method, it knows if the machine has powered up, or the user has press RESET (provided that running software hasn't corrupted the numbers).

For that scheme to work on the 400/800, a customized OS would be needed, since those machines assume a RESET to be a coldstart, which will clear the RAM of the machine.

The only condition where RAM isn't cleared is if a "diagnostic" cartridge is present (some game carts are defined as diagnostic carts, and do their own power-up initialization).

The best method to have an 800 do a power-on RESET through a switch would be to have it wired to the RESET pin of the 6502. It has been done by many people, but I don't have any linkage for it.

If you have the skills for C, why bother using the OS graphics calls.
They are slow and inefficient.

I've written ASM plot/draw routines and they run 5x or more the speed
of the OS routine.
Just use the algorithm described in the OS manual for drawing lines,
it's the best there is.

Also, the OS fill routine is useless, it only does a basic polygon.
Proper fill routines use a stack where co-ords for new areas to be
filled are stored. There is source code for a fill routine (diamond
algorithm, not the fastest, but relatively light on memory use) one of
the old Analog magazines (the one with "Atari Graphics" as the cover
theme).

You want a Commotari computer, don't you.

qWhen you wrote this, I came to think of the idea to transplant
at GTIA chip to a Commodore 64.

So long as it has the A8 operating system, DOS(es), Screen Editor, and
Languages. ;-)

But seriously, seems like a SID cartridge would be fairly feasible --
with direct output to a mini-amp.

Hi, Roy;

Do you have any instructions or hints and tips from experience?
I grabbed this and have no success; It loads nicely with a
colorful screen
and then the playfield. Option and Select choose mode and level
and I
can put 0 to 9 into the top corner box. Downhill from there;
cursors and
Return have no effect and Start generates pink WA T (missing I)
and lock
up requiring reboot.

That mod from Clarence's page is good, but there is a slightly
easier
one around somewhere. I have a dot matrix print out from a long
ago
BBS that uses only the momentary switch and one resistor IIRC. It
was a snap when I installed it.

Hi RetroJess,

It sounds like you got a bad download. Press START then wait for the game to generate the .... GIVEN numbers. ..(1-2min). depending on level you started with... the wait should be gone and number grid up and ready to be filled in I haven't tried to get it to solve any newspaper puzzles yet.. but the cursor keys are normal right/left up/down when you place a number just press the number key. I think there is a doc file readme with the zip..

6043. classic 8-bit equipment for sale

Newsgroup: comp.sys.atari.8bit
Date: 2006-03-11 03:49:25 UTC
From: John Smith <someone@microsoft.com>
Message-ID: <IMrQf.774$KR5.5@fe02.lga>
Source record: 7400

I have the following classic 8-bit equipment, all of it looking for a new home:
(2) 800s with pwr supplies
(1) 400 with pwr supply
(4) 810s with pwr supplies
(2...I think) 850s with pwr supplies
a pile of misc parts and test mdules

I prefer to sell it all at once. Drives will likely need alignment. Last time all powered up and worked well, but that was several years ago. Buyer pays all shipping in cont. U.S.

Please correct me if I am wrong but doesn't that "hard-RESET" circuit
interupt main power?

Actually, the switch connected to the /RESET pin appeals to me. A Cold
Start is fine as all I want to do is select a new image in my homebrew
multi-cart and restart, without killing main power.

Worked fine for my in Atari800 on Linux, but that's set up for PAL.
My Atari 800XL currently has an NSTC ANTIC in it, and it didn't get
very far beyond the (pretty!) title screen. Started flipping out. :^/

Must be PAL only???

> As promised:

Thanks! I've been able to get DRAWTO and XIO-based fill working
(again, just for fun... to bootstrap myself and get used to cc65'ing
things, more than for any actual real use).

However, for the LIFE of me, I cannot get PLOT (aka POSITION & PUT) working!

```
void _plot(unsigned int x, unsigned short y)
{
#define iocb6 (*(struct __iocb *) 0x3A0)

POKE(84,y);
POKEW(85,x);

iocb6.command = 11;
iocb6.buflen = 0x0000;

asm("lda $02FB");
asm("ldx #96");
asm("JSR $E456");
}
```

What the heck am I doing wrong? It ends up being a No-Op!

I created a little C version of the "American Flag" plot/drawto demo
from the Atari BASIC manual, and it comes out all wrong. :^/

(I can post my full source, if anyone cares, but the above snip is what's not
working, so far as I can tell!)

Thx!

No, Steve;

When done correctly, it just forces the system to restart as if
the power had been cycled. The OS routines clear normal RAM
areas and leave any extra RAM containing virtual disk info
untouched. This and avoiding a power shock to the chips are
why they were devised. It does look similar to a power cycle
as the screen goes black when the process begins.

If you are in control of the system with access to Basic or DOS,
you can always do a X=USR(58487) or load a simple binary file
with a JMP $E477. These jumps to the cold start vector are not
available developing apps in assembly where bad code can leave
you totally locked up in never never land.

bill@newbreedsoftware.com (William Kendrick):

>However, for the LIFE of me, I cannot get PLOT (aka POSITION & PUT) working!

I don't know that I can be much help, since I have never used it. I did
some searching through the usual reference manuals, and I couldn't find any
notes about how to do a plot with CIO.

```
>void _plot(unsigned int x, unsigned short y)
>{
>#define iocb6 (*(struct __iocb *) 0x3A0)
>
> POKE(84,y);
> POKEW(85,x);

> asm("ldx #96");
> asm("JSR $E456");
>}
```

Does the OS plot routines expect to see the character to be plotted in the
A register or in one of the IOCB bytes?

Based on an Insight Atari article on the subject, it sounds like
the A register:

http://www.atarimagazines.com/compute/issue89/Insight_Atari.php

```
;
;
;PUT channel,byte
;
;Parameters: A register holds byte to output
; X register holds channel number
; On exit: Y register holds error code
;
PUT
TAY ; save the byte here for a moment
LDA #0
STA ICBLL,X ; $0000 to length
STA ICBLL + 1,X ; as noted last month
LDA #11 ; the command value
STA ICCOM,X
TYA ; data byte back where CIO wants it
JMP CIO
;

;
;PLOT x,y,color
;
; Parameters: A register holds color
; X register holds x location
; Y register holds y location
; NOTE: not for use with GR.8 or GR.24
;
PLOT
STX COLCRS ;see my August column
STY ROWCRS ;these are just POKEs
LDX #$60 ;the S: graphics channel
JMP PUT ;color is already in A
;
```

Heh, yeah, in that case, the C=64 is then beat by Atari's HIP, RIP and
ColorView modes. ;^)

I guess if you want to solely use your computer for static images, and give live with a reduced resolution, the Atari graphics would be superior as IFLI does flicker depending on your monitor. But if you want multiple bi-directional multi-colored sprites, more available CPU cycles and higher usable resolutions, then you'll probably want to stick with a VIC-2.

Not trying to start a flame war here guys, I like both machines. I'm growing rather fond of the Atari's disk and peripheral system, as a matter of fact. But the SID and VIC-2 are just better in my opinion than the graphics and sound in the Atari's.

The Atari was in a way a generation ahead of its
competitors. The visual impression of the 256 colour
mode was somewhere between the 8-bit generation and the
16-bit computers released in 1985.

But I agree the VIC II chip was fantastic and with
regard to use in two dimensional arcade games, better
than the Antic/GTIA.

To return to the original question, if it would be
possible to transplant the SID chip to the Atari, my
suggestion is that extra hardware logic is added to
be backwards compatible with POKEY calls.

Hardware logic to translate addressing, read and
write operations for the POKEY to SID operations. To
get four sound channels, two SID chips would be
required. With clever mapping of POKEY operations,
most Atari games would work.

Then a software utility to change the characteristics
of the emulated POKEY sound that the SID chips
produce. For example, the waveform could be changed.

Anders

I don't think using the SID on the ATARI would be such a big deal, for example Atari put it's POKEY custom chip in Atari 7800 carts. I suppose an Atari cart could be rigged up with a SID style chip as well. A custom cartridge add on, that would need custom handlers etc.. to access, so POKEY compatible software would still work 100%.

Something like this would prob take a lot more work then it is worth. It would only be useful for playing SIDTUNES, since not enough people would ever own one to warrant a home brew SID/ATARI game.

If you were going to add a new sound cart, why not take a sound blaster chip or something like that? Or if you insist on retro modding your 8bit, you could prob cook up a rom cart that could host a PAULA chip from the Amiga. That would be cool and somewhat fitting since Paula is Pokey's direct descendant.

As far as Commodore vs Atari custom chips. The Atari has more colors and the Pokey does video game sounds (like explosions/lasers etc..) better (largely because Pokey's was used in many Atari arcade games). The Commodore 64 has more sprites w more colors and does instrument style sound better. There are advantages and disadvantages to both platforms (for example Atari is over all faster both cpu and definitely disk access, the commodore has more colors in it's hires mode) but in the end there were lots of ways to get around the hardware and squeeze what you needed into either platform, so it comes down to a matter of opinion. Afterall they were both outdated 20 years ago! 20 years ago the Amiga vs ST debate was in full swing.

6062. Atari SIO cables

Yes, that would be possible. You could, for example, built it
into a cartridge. This way you'd only need the PCB, a SID,
and a few additional parts to get a standard (Cinch) audio
output.

> my
> suggestion is that extra hardware logic is added to
> be backwards compatible with POKEY calls.

This isn't possible at all. SID and POKEY are just too
different.

so long,

Hias

Not recommended, because this bypasses CIO and thus all
error checking within CIO. It is also something device drivers
regularly have problems with. To write the data in the A register,
it is enough to set the length to zero - and load the data into
A.

So long,
Thomas

Mark,

AFAIK, there was a program that combined two sound registers to
produce 16 bit sound. Might have been in a Compute!, Antic, or Analog
magazine. I will have to do some looking for the code.

Rory

Well, for simple stuff, you just do, for example:

SOUND 0,100,10,10

Where it's:

0 = Voice (0 thru 3)
100 = Pitch (0 (highest pitch) to 255 (lowest))
10 = Distortion (in this case, a kind of 'pure' tone; other values cause
different kinds of sounds... 0 and 8 sounded like explosions or
the ocean to me... 12 sounded kind of like a horn)
10 = Volume (0 (off) to 15 (loudest))

Doing two sounds very close together caused a neat interference(?) effect,
that sounded kind of like a Star Wars light saber, to me:

SOUND 0,190,10,10
SOUND 1,191,10,10

You can no doubt find a plethora of details in books which are now
available online, such as Compute!'s First Book of Atari, and the like:

http://www.atariarchives.org/

Good luck!!!

You could use the SOUND statement to turn on and off a sound channel
with a specific pith.

Try for example:

SOUND 0, 140, 14, 15

The paramers are sound channel (0-3), pitch (0-255), distortion
(0-15) and volume (0-15). Change 140 a couple of times until you
are as close as you can get to 10 kHz. Maybe you have a reference
tone source to check with, to find the value that comes closest to
10 kHz.

If the 8 bit pitch resolution is not accurate enough, one can use the
16 bit mode. There is no BASIC support for that. In other words,
you have to use POKE statements to enable the 16 bit
mode. Below is a link to a page with a BASIC program that
does this.

http://www.atarimagazines.com/v4n5/soundpower.html

Good luck!

Anders

The frequency of a sound is determined by the simple formula:

Fout = HostClock / (AUDF+1) / 2

where HostClock is 1.7784 MHz for PAL, 1.79208 MHz for NTSC.
AUDF is an 8 bit number (2nd parm in SOUND statement) or a 16 bit
number if you join 2 voices together.
The problem with 8-bit sound is less range, plus the steps are
extremely noticable at high frequencies (ie low AUDF values).

I thought the base clock for BASIC Sound statement is 64 KHz and
Fout=Base Clock/(AUDF1-255)/2.

Your formula would give a range of frequencies from 3500.15 Hz to
89.6040 Khz (for NTSC).

I have always liked this sound mode. It is a bit arcade-ish.

This semi distorted waveform is probably used to create the engine
sound in Atari's Pole Position and the short music sequences heard when one
locks/unlocks doors in Synapse's Zeppelin.

Is it possible to combine two channels to 16 bit and play with the mode 12
type of sound?

> sound in Atari's Pole Position and the short music sequences heard when one
> locks/unlocks doors in Synapse's Zeppelin.

It is also helpful to extended the available frequency range towards
lower frequencies and still have four channels available. This is
for example done by "Musica".

> Is it possible to combine two channels to 16 bit and play with the mode 12
> type of sound?

Yes, of course. In this case, the mode-12 polycounter is driven by the
output of the combined timer.

So long,
Thomas

Make that 896.604 Khz. (Yes, I can use a calculator. Apparently I
can't count 3 decimal places though. LOL!)

I think the Atari drive was 38.4k *bits* per second, and I read that
the C= was normaly 3k *bytes* per second but did 4k in CP/M mode. I
don't know how much was overhead, but ther're close enough to each
other that it really doesn't make much difference.

But all tones produced with the 8 bit mode are a bit out of tune, aren't
they?

> can't count 3 decimal places though. LOL!)

[cough cough]

Forget everything I said, or almost everything.

The normal base clock (Fin) for BASIC Sound command is 63.9210 Khz (for
NTSC systems).

Fout=Fin/2*N where N is the 2nd parameter + 1 of the Sound command
which is also the AUDF1 value + 1.

You can't generate an exact 10 Khz sound with the Sound command. The
closest you can come is by using the value of 2 for the 2nd parameter.
This yields Fout=63.9210 Khz/(2*(2+1)) or 10.6535 Khz.

You can improve not the resolution but the granularity simply by
changing Fin.

To Change Fin to 1.78979 Mhz Poke a 64 into 53768 (AUDC1)

There is a revised formula for Fout with the Fin=1.78979 Mhz

The formula for the exact frequency becomes

Fout=Fin/2*(AUCF1 + M)

where
M=4 for an 8 bit counter (the norm for BASIC Sound command, AUDC1 bit 3 or 4 = 0)
M=7 for a 16 bit counter (AUDC1 bit 3 or 4 = 1)

You still can't generate an exact 10 Khz sound with the Sound command but by using

```
10 SOUND 0,85,10,10
20 POKE 53768,64:REM set Fin to 1.78979 Mhz
30 STOP : REM keeps the sound playing
```

However, if I did the numbers right this will generate a sound at 1.78979 Mhz/(2*(85+4) = 0.010055 Mhz or 10.055 Khz.

Hope I got it right this time!

Try the following program for fun.

```
10 SOUND,255,10,10
20 STOP
30 POKE 53768,64
40 STOP
```

Run the program. Listen to the sound. Type 'CONT' and press Return to change Fin to 1.78979 Mhz. Listen to the new sound. Type 'CONT' again to stop the sound

note: most of this information is from the Atari 400/800 Hardware Manual.

I have decided to reduce my inventory of classic computers, so reluctantly the ST stuff must go. I have a medium-sized collection of ST stuff including a Mega 4 STE, 1040ST, a couple of hard drives, floppies, Diskcovery cart,software, disks, mags., etc. I estimate it will fill a trunk of a full-sized car, and maybe some to the back seat, but a pickup truck should not be necessary.

If you are interested, here are the "rules:"

1) PICKUP ONLY -- central Indiana -- southwest of Indianapolis.
2) AS-IS. It's been stored in my (heated) garage and family room for about 10 years.
3) ALL or NONE. You take it all -- no pick and choose.
4) The actual pickup date will be at mutual convenience in later April or May -- after the weather has settled a bit, and I have a chance to separate the boxes of items.

If interested, "reply to author".

Thanks,
Larry

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hi, I try to connect my old discman mp3 player to my atari 800xl
computer and its works :D. In 2 cds i can carry about 1000 games :)

See how I did:

http://erwin.ried.cl/?modo=visor&elemento=176

btw: is in spanish :(is my main language, but has many photos ;)

Thanks

I don't know the speed of the C64. The Atari is about 19.2Kbaud.
I believe the Commodore stock was/is much slower. I remember
loading commercial games from disk as taking 10 minutes or more,
about 300baud. I remember the C64 disk drive being about the
same as an Atari tape drive.
Some speed inhancements were available, using a different
port on the Commodore, but we're talking stock machines using
stock drives.

stock c64 with stock 1541 can load 40K in about 8 seconds without breaking a
sweat, enhanced using software only. Nobody uses the dud kernel routines :)

Beside, the subject is comparing to the 1571 and since that's a 128
centric device, you should compare it using burst mode, which is PDF
(pretty damn fast).

This is also true, but Im unaware of just how fast burst mode is. I have a 128 and 2 x 1571s, but I rarely if ever boot into 128 mode.

Point being, all the bad press commodore got for their drives was pretty much unfounded once you dumped the admittedly atrocious kernel routines.

As I understand it, the Kernal routines for C64/1541, and 64 mode on the C128, were written to maintain backwards compatibility with earlier CBM computers and drives.

There may be some details on the website listed below. It has been a while since I read this history through so I don't remember exactly how many details...

Ah. I didn't know much about the Commodore.
And I probably only ever used the 'kernet' (OS?)
routines. But still, if you have to load software
to make it faster, is that 'stock'? Atari has
to have DOS loaded, so that is the same, I guess.
The Atari boots the DOS, how does the Commodore get its' high-speed routine?
You load it first, or does it boot?

Most C64 commercial games use a fastloader that comes on the game disk.
Typically, the fast loader is part of a small boot file on the game disk.
You load and run the boot file which installs the fast load routines and then
loads the main game module, and any other files needed to start the game.

Stand-alone fast loaders are also available which, after they are loaded,
allow you to load your own BASIC programs, or other software that does not
have it's own fast loader, at greater speeds.

If its within a program (a game, or utility) typically the 'fastloader' is installed at boot - a small boot file loads some code into the disk drive and replaces the kernel routines, then goes on to load the rest of the program. I guess its somewhat like booting a DOS.

For day to day use, youd probably be better off with a hardware based approach (like an epyx fastload, action replay etc) just so you dont have to keep reloading a fastload wedge :) It is hardware based, but its just a plugin and requires no soldering :) However for someone who is simply an end-user (plays games, writes letters) this is probably unnecessary as the bulk of games/utilities come with their own software fastloaders.

And don't forget JiffyDos, which when equipped in both the drive and the
computer, provides 2-bit parallel communication over the IEC port, plus
removes a lot of the IEC chattiness of the stock routines, which makes
is one of the fastest solutions available; it's even faster than Burst
mode that Commodore supplied on the 128.

40K bytes in 8 seconds. 5K bytes per second = 40k bits/sec or
so. About 40K baud.
I remember a command that loaded most commercial C64/D128
disks. 'LOAD *' or something like that.
The Atari can go up to 56K bits/sec. using certain DOS and
a modified disk drive. I'm not sure the 'WARP' speed of
our peripheral emulator emulating disk drive from the serial
port of a PC, maybe 115,200 baud.
I don't like high speed features because they generate errors
on real disks, or failures with the disk emulators.
I prefer the 19,200 stock speed, our drives are getting old
and I'm more interested in reliable reads/writes than unreliable.

I use CRC check programs to make sure disk transfers are
correct. You might be surprised how many errors there are
in disk tasks. This is important with PCs as well. I just
found bad sectors on a 1.44 floppy using PCs. What bothers
me is that the read is encountering error sectors, but no report
of a disk error is occuring, just a program termination with
a failure. People don't expect read/write errors, and software
doesn't respond with a report of error. On the Atari, you
hear a 'chhhiiit' on an error sector, many people like to turn
the drive noise off, they are removing a source of info about
the health of a load. Sometimes it's a 'SNARK GRUNGE'
sound.
But I ramble.

You know about Fast Hackem for Commodore 64, provides a direct drive to drive Ultra Fast copy without sending data to the computer memory. I am wondering if the direct drive to drive copy is available for Atari?

I never read anything said that. IIRC, JiffyDOS is not the
fastest (in order to retain compatibility). There are others that are
faster than JiffyDOS.

>> example.

> Not recommended, because this bypasses CIO and thus all
> error checking within CIO.

Eh, not recommended ? By who and why ? If you had properly opened
IOCB f o r w r i t i n g without error then nothing can be wrong.
Now errors has to be reported in Y (Y>=$80) register by handler proc.
If you suffer from errorphobia :), then you may set Y to $92 as CIO
does (func. not implemented) before jump to handler.
Error checking by CIO (if everything gone well so far) is just
checking Y register after return from handler procedure.

> It is also something device drivers
> regularly have problems with.

This means one thing - device driver is f...ed up. Handler
PUT BYTE proc. cannot expect more info than it gets from CIO
and has to return status in Y.

>To write the data in the A register,
> it is enough to set the length to zero - and load the data into
> A.

That's should do it too, cause with command 11 CIO treats
length 0 as 1 and stores A as a first byte to go, but it does
more things (as, for example, rewriting 12 IOCB bytes (twice))
wasting time and not needed to put byte things (like plot).

That would make it faster then.

I didnt want to get into a pissing match (we'll leave that for the speccy guys) but I just wanted to point out that the drive situation on the 64 isnt as bad as people make it out to be.

According to my sources it may be 15kHz 64kHz or 1.77 MHz.
Llast one I don't know if it's really PAL/NTSC relative as Stephen
wrote but it's possible (just clocking with main computer clock).
Mine docs says it's 1.77. Could check it if I had NTSC stuff ;P

So lets say it's (B)ase clock ;P and (D)ivider can be:

for 8bit register D=2*(AUDFx+4)
for 16bit it's D=2*(AUDFx+7)

Frequency (F) is F=B/D

No, because the Atari drives are not programmable.

> 1581 78 3.92 10 30.56 7 43.66

I measured the time needed to read a full DD disk (720 sectors,
256 bytes per sector) on the Atari. Transfer rate is in kBytes
(1000 bytes) per second:

XF551 std speed: 128 sec -> 1.4kB/sec
XF551 hi speed: 80 sec -> 2.3kB/sec

1050 Speedy std: 114 sec -> 1.6kB/sec
1050 Speedy hi: 53 sec -> 3.5kB/sec
1050 Speedy hsscopy: 44 sec -> 4.2kB/sec

AtariSIO std: 100 sec -> 1.8kB/sec
AtariSIO xf551: 57 sec -> 3.2kB/sec
AtariSIO hi: 34 sec -> 5.4kB/sec

The Atari serial bus (SIO) does data transmission just like the
RS232 standard: 1 start bit, 8 data bits, 1 stop bit. Transmission
speed is derived from the main crystal and is slightly different
on PAL and NTSC computers:

Standard transfer rate is approx. 19 kbit/sec, XF551 high speed
is approx. 39 kbit/sec and 1050 speedy high speed is approx.
56 kbit/sec. 1050 speedy hsscopy uses someting like 80 or 90
kbit/sec. Note: hsscopy speed is only available when using the
speedy "highspeed sector copier".

AtariSIO is a floppy drive emulator that I wrote for Linux and
uses the standard RS232 transmission speeds of 19200 bit/sec
(standard mode), 38400 bit/sec (XF551 compatible mode) and
57600 bit/sec (highspeed mode)

The stock Atari 1050 disk drive can't do true double density,
the Speedy is a hardware extension built into the floppy drive
which is very popular here in Europe. It's similar to the
"Happy" upgrade. Both floppy speeders have some RAM on board

that is used as a track buffer (stock Atari disk drives don't
have a track buffer).

If you have a look at the net transfer rates, it is very obvious
that the raw transmission speed is not that important when comparing
drives. When using the standard speed, the results are quite close
to the maximum limit of ~1.9kbytes/sec. If you increase the speed,
disk drive latency (waiting for the next sector, stepping to the
next track) becomes more and more important.

Of course you can't compare the AtariSIO rates with the rates
of real floppy drives (since AtariSIO doesn't suffer from the
latency problems), instead use these values to get some impression
of the SIO protocol overhead (it's not too bad, only 8 bytes per
data frame plus some 2 milliseconds of minimum delays).

so long,

Hias

I guess that depends on the kind of games you play. Many commercial games for the C64 that I remember came with a speed-loader. Though speed-loader cartridges where also quite popular where I live. So I agree with Simon that the C64 drive situation wasn't nearly as bad as some people made it out to be.

No C64 setup was complete without an Epyx Fastload where I grew up. :)

It just wasn't usable without one.

I write a journal on my 130XE with AtariWriter 80. Recently I purchased the MyIDE+Flash cart. Unfortunately, AtariWriter 80 (an plus) switches back on the Atari OS and expects to load from SIO, so it can't be loaded from the MyIDE cart. I'd like to find a word processor that will load from MyIDE and has a printer driver for the HP Laserjet Series II. Anyone have suggestions?

TIA

I recently tried to write a short routine for an autorun file to use with MyDOS to format D9:, my damdisk. Well, I figured out a method to do it, but... it doesn't work. :(

Before I can perform a DOS XIO on any disk, do I first have to open that channel for write or what?

I would greatly appreciate a complete example of how to format a disk in assembly.

Thanks!

There is a program called 'Fast fingers', a BASIC program
that writes and autorun.sys that will type anything you would
type at bootup time. It worked quite well with DOS 2/2.5/SmartDOS, so I
would thing MyDOS. It is essentially
a way to make a STARTUP.BAT for MyDOS, like you have
in Sparta/FteDOS. It is from an ANALOG I think. I have
a copy.
It shouldn't be all that hard to make an assembly program to
do what you want, tho.

I prefer to work in assembly whenever possible. And I have recently started
playing around with I/O with it, but I'm just trying to find out how to
format a disk. Should be fairly simple, but I'm skiddish to just jump in and
play around... I could bork my hard drive pretty good if I make one small
mistake. :)

Hi David-
Bill Wilkinson wrote a series on graphics and I/O in assembly language
in his Insight: Atari columns in November, 1981 through January, 1982.
Part of these is already posted at the Atari Magazines archive. The
others will soon be posted. There are certainly other sources, but
Bill's was an excellent start, IMO.
You can also search by author at the site.

It depends. When formatting a disk, you don't have to open the channel
first. When using note/point, you must use an open channel (of course).

> I would greatly appreciate a complete example of how to format a disk in
> assembly.

Using XIO is quite simple. Just set the command to the XIO number
(eg. 254 for "format disk") and set up the buffer address, AUXx
and (if needed) length.

Have a look at the MyDOS tech doc for an explanation of the
AUX1 and AUX2 bytes in the "format disk" function.

Here's some sample code that formats a disk:

CIOV = $E456

ICCOM = $342
ICBAL = $344
ICBAH = $345
ICAX1 = $34A
ICAX2 = $34B

LDX #$10 ; channel #1
LDA #254 ; format disk
STA ICCOM,X
LDA #<DRIVE ; buffer = "Dx:"
STA ICBAL,X
LDA #>DRIVE
STA ICBAH,X
LDA #0 ; aux1, aux2 = 0, standard format
STA ICAX1,X
STA ICAX2,X
JSR CIOV
RTS

DRIVE .BYTE "D4:",155

Could you please send me some more information, I'll try to track down
the issues. Which distribution are you using, which kernel version,
which gcc version, what's your kernel .config, what kind of errors
do you get etc.

The most recent kernel version I've tested AtariSIO with is 2.6.14,
IIRC I used gcc 3.3 (it's a Debian Sarge box).

BTW: If you contact me by email I'll send you my latest development
snapshot.

There's SIO2Linux at http://www.crowcastle.net/preston/atari/ that is
entirely in user space, so it should work with any Linux system. It works
great for me, but I've heard reports of problems; I'm guessing that not
all of the SIO2PC cables out there are compatible, so it only works for my
type of cable.

Unless the program is using the RAM under the OS, there isn't really any
reason for it to be fiddling with $d301, so you might be able to patch the
program to stop it from doing this.

It seems like quite a few programs set $d301 to a "sane" state even though
they don't really need to use any of the memory banking features.

Some programs also do it the quick and dirty way (for example
AtariWriter): instead of doing a "LDA $D301 / ORA #2 / STA $D301"
(to switch basic off) they just do a "LDA #$FF / STA $D301".
The sames also often true when programs set the extended memory
banks. Quite annoying...

Yesterday I patched some game files so they can be used with the
flashcart (the flashcart also installs a patched OS in the RAM
under the OS).

So I had a look at Atari Writer Plus: The .COM file has some blocks
with memory location $D301 so the can simply store parts of the
code in the extended RAM. The code itself also contains parts
like "LDA #$E3 / STA $D301".

Changing the software so that it works cleanly with and without
the MyIDE flashcart would be quite tricky, so I just patched the
.COM file so that it will work with the MyIDE flashcart
(and with the MyIDE soft OS). Here's the patched file:

http://www.horus.com/~hias/tmp/ap.zip

BTW: patching file was quite easy. I just disassembled the .COM
file, then searched for all occurrences of $D301 and used a hex-editor
to change some values. Took me 5 minutes or so :-)

so long,

Hias

I just did a test with a chroot installation of Debian Etch using
Kernel 2.6.15.6 and gcc 4.0.3 and saw that there are quite some
errors when compiling with -m64 (-m32 works fine).

Please contact me by email and I'll send you a fixed version.
I don't have 64bit machines, so I can't test it by myself, all I've
got for now is a nicely compiled and linked 64-bit executable
resting on my harddisk...

Caution is to be advised as David could still bork his hard drive very good. There is a bug in MyDOS where Marslett didn't understand the proper setting for a 'no ramdisk' value as zero and not $FF. The CIO routines then takes Marslett's ramdisk drive number value of $FF stored at $070A and converts it to D1: and the format is ON - Good bye hard drive. Drive 1 on your hard drive system will be formated as a 720 sector disk and not the bigger (up to 655535 sectors) one that you used to have, a real PIA. It happened here twice and now I never have the hard drive write protect switch off unless I'm storing a file on my hard drive. Can I suggest to David that he take a look at my Myrd and Myrd2 ramdisk formatter/autoloader programs? More to the point, the source code for same (myrd2.arc) available on the MyDOS page at: http://www.mathyvannisselroy.nl/index.htm

Hias's code above will work fine IF location $070A contains a valid drive number from 1 thru 9 and 9 only works if it IS the ramdisk, whereas the ramdisk can be any drive number from 2 thru 9. BUT there is a further bug in MyDOS where the XIO format function is broken in that it will NOT accept aux1, aux2 values as gospel and do the format as stated in the manual. It will format the drive specified but only as that drive has been configured prior to leaving DUP.SYS to do either BASIC or assembly programming and/or running of machine language programs from the (L)OAD function in the menu screen of MyDOS. Mathy Van Nisselroy discovered this XIO bug when attempting to write a TurboBasic program to do all available formats from there instead of using MyDOS's menu methods. His only recourse was to do the format at the SIO level and then write the boot and VTOC sectors from TurboBasic instead of allowing MyDOS's XIO function to do that for him.

Mathy did write to the drive in question a proper configuration block prior to a matching XIO format attempt - still no good. We got the right format but with the wrong VTOC sector, or other odd arrangements including double sided formats with single sided VTOC sectors and vice versa. The manual is simply wrong about MyDOS XIO format functions, it doesn't work as stated always. If the desired format has been preconfigured via O and P options in the menu of MyDOS then it works perfect, otherwise you can get garbage for your efforts. We hope to fix MyDOS so that it complies with the manual in every respect - someday.

Money Making Try It Works!
HELLO, I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of 6.00! So I thought, Yeah right, this must be a scam, but like most of us, I was curious, so I kept reading. Anyway, it said that you send 1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at...6, and post the article in at least 200 newsgroups (There are thousands). No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: what have I got to lose except 6 stamps and 6.00, right? Then I invested the measly 6.00. Well GUESS WHAT!! Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about 25.00. By the end of the second week I had made a total of over 1, 000.00! In the third week I had over 10, 000.00 and it\'s still growing. This is now my fourth week and I have made a total of just over 42, 000.00 and it\'s still coming in rapidly. It\'s certainly worth 6.00, and 6 stamps. I was in a bad economic state before I found this article... I didn\'t believe this really worked until I ACTUALLY started getting mail from all over the world... I bought everything I needed... This idea came in the right time exactly :-) Let me tell you how this works and most importantly, why it works....Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions and watch the money comes in! It\'s easy. It\'s legal. And, your investment is only 6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really Works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends. PLEASE NOTE: Please follow these directions EXACTLY, and 50, 000 or more can be yours in 20 to 60 days. This program remains successful because of the HONESTY AND INTEGRITY of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it\'s a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.

Here are the 4 easy steps to success: STEP 1: Get 6 separate pieces of paper and write the following on each Piece of paper; PLEASE PUT ME ON YOUR MAILING LIST. Along with your name and address. Now get 6 US 1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a 1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

1) Arik Stephens r.r.2 box 251e St. Elmo, IL 62458

2) Scott Miller 9537 Leyendekker ct. Lakeside CA 92040

4) Tyler Otto 271 Weston Cir apt 21 Vista, CA 92083

4) Rashantees, PO Box 708, El Cerrito, CA 94530

5) Magus c/o Bob Condor 1242 South Portage Rd, RR2 Haliburton . Ont. Canada K0M1S0

6) Jonathan Burnett, 842 E. Co. Rd 60, Mendon, IL. 62351

STEP 2: Now take the first name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR NAME as number 6 on the list. STEP 3: Change anything you need to, but try to keep this article as Close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24, 000 groups) All you need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again and again. PLEASE REMEMBER that this program remains successful because of the HONESTY AND INTEGRITY of the participants and by their carefully adhering to the directions. Look at it this way. If you are of Integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a Good idea to wrap the 1 bill in dark paper to reduce the risk of mail Theft). So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the...1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only 6.00 (1.00 for each of the first six people listed above) Send it now, add your

own name to the list and you\'re in business!
---------- DIRECTIONS FOR HOW TO POST TO NEWSGROUPS----------

STEP 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and Drag your cursor to the bottom of this document, and select \'copy\' from The edit menu. This will copy the entire letter into the computer\'s Memory.

STEP 2) Open a blank \'notepad\' file and place your cursor at the top of the blank page. From the \'edit\' menu select \'paste\'. This will paste a Copy of the letter into notepad so that you can add your name to the List.

STEP 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you\'ll always have this file to go back to.

STEP 4) Use Netscape or Internet explorer and try searching for various Newsgroups online forums, message boards, chat sites, discussions. (Just example you log on any search engine like yahoo.com, google.com, Altavista.com, excite.com then you search with this subject millionaire Message board, or money making message board, or employment message Board, or money making discussions, or money making forum, or business Message board etc. You will find thousand & thousand message boards.)

STEP 5) Visit these message boards and post this article as a new Message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a Particular group, click the post message button. You\'re done with your First one! Congratulations...THAT\'S IT! All you have to do is jump to Different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200 That\'s it!

You will begin receiving money from around the world within Days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. REMEMBER; PLAY FAIRLY and HONESTLY, and this will really work. Good Luck to you all!!!!!!!!!!!!!!!!!!!!

(newsgroups have been down here - I've been trying to post this for 3 days!)

First of all, Happy New Year everyone! :-)

We're trying to kick things off right at The DarkForce! BBS, so in the spirit of the season, we are continuing our tradition of monthly prize giveaways.

This month, January 2006, one lucky Atari caller will win a free subscription to ST Magazine. Also, since its almost NFL playoff time, this months featured game is AFL Football! The lucky winner of this game will receive a $25 cash prize. Slots are limited to the number of teams available so don't be left out. Also, rumor has it the Sysop is playing...who doesn't want to take a crack at bashing the Sysop? :-)

Good luck everyone! :-)

This is as opposed to the 1084s, right? It had stereo sound.

If we could only get the C64 music to play with the Atari color cycling, M.U.L.E. Catari would be perfect! If you've never heard the M.U.L.E. music played on a C64 then you're missing out! I will also say that the Atari isn't as second fiddle to the C64 for this type of game when it comes to graphics as the extra vertical 8 pixels don't seem to be missing compared to the C64 and the additional colors are obviously welcomed.

Personally, nothing compares to the MULE music on the atari for me.

You betcha - although I can't explain why, whenever newsgroups goes down
from my ISP, when they do finally come back up, the first 1-2 times I
access the newsgroups I'm subscribed too, well, old, old messages get
reposted.

This is using PAN under Linux.

Anyone have any ideas as to why? I've had it happen several times. :-(

Possibly, after your ISP sorts out the usenet problems, they fiddle with
the message ID counter for each group, as a safety measure. Pan cannot
know this, so continues with message ID's it has, resulting in the
retrieval of old messages.

I realize this is an 8-bit group, but what the heck :). I'm largely interested in all the Atari PEECEE type computers (as well as earlier 8-bitters and the ST series), but in particular I'd like to obtain the PC2. I live in New Jersey presently, but it's my understanding they were available in Canada (well I saw one on Ebay in Canada). Please contact me offlist. Thanks.

Very interesting. So I suppose the easiest method of verifying the presence
of D9: as a ramdisk would be to try and get a directory listing. If it
errors out, abort format. Since MyDOS initializes the RD and it appears, at
first, as a disk with 65535 sectors, I will at least be able to read that.

What do you think?

This March I'm celebrating my Birthday! If you want to bless me, I'm trying to raise Capital to buyout an Atari Dealer of all his Atari goods! So give me your Atari business, send all Atarians Marching my way and help save Atari goods from extinction, buying from Ben Saves Atari!

I'm creating a NEW Atari catalog. Catalog's name is NEWINBOX.TXT compiled from all items NEW in BOX from all my other catalogs made up of Hardware, Games/Software and Books for the 8 Bit, ST & Jaguar! Instead of 38 columns of text width it will be 80 column width, Most entries will be 1 line each and sorted alphabetically by title. You'll only find my NEW items in this catalog as I'm removing such NEW item's from their other catalogs.

http://BensCatalogs.Atari.org Atari's for sale!
http://www.aracnet.com/~atari/adoption.htm Atari Adoption Agency!
http://www.aracnet.com/~atari/birthday.htm Ben's Atari Birthday!
http://www.aracnet.com/~atari/wantlist.htm What Ben Wants!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

As a matter of fact I have a C64 emulator for my PSP solely for the purpose of playing M.U.L.E. on-the-go. Overall I would have to say the Atari version is my favorite though; graphics, sound, everything. I am not knocking the C64 version at all, but I think the Atari version is much better in all respects. Hey, to each his own; I've met some people who think the NES version is the best, surprisingly enough.

If I remember correctly, MULE was one of the few games that took advantage of all 4 joystick ports on the 400 and 800 and allowed 4 simultanious players.

I liked "Floyd of the Jungle" for the same reason.

Can MOS 6502 be replaced with WDC65C02 Microprocessor? The WDC can fit with Atari 8bit family and Apple II family...

Yes, it is compatible electrically, and no,
the WDC is in a PLCC package.

Huh? I have 40 pin DIP WDC chips. I've bought 40 pin DIP directly from WDC.
I haven't directly tested the WDC 65C02 in all II's but in a IIe it should
work just fine. I had problems getting some 65C02's to work in the IIplus. I
seem to remember RAM not liking it.

> The WDC can fit with Atari 8bit family and Apple II family...

Apple II -> yes

Atari 8 bit -> no! (at least not as a simple replacement)
The Ataris use a modified 6502 - called 6502B. It differs in only one feature from the normal 6502: It has a special interrupt line which the graphics processor ("ANTIC") uses to stop the 6502 and gain DMA access to the RAM.
The 6502B is therefore not pin-compatible. You 'd have to build extra circuitry to add this interrupt line to a "standard" CPU like the 6502 or 65C02. And if you have to do that you may use a powerful CPU like the 65816. (Then a plethora of other problems will arise - like system timing. But that's another story .)

C64 -> no! (I know you didn't ask ;-)
The C64 uses a 6510 which is a 6502 with two additional registers (at addresses $0000 and $0001) to control the memory management (disabling the system ROMs, for example).
So its even more complicated than with the Ataris - which didn't stop people to build accelerators, though...

bye

Thanks. I don't think that will work like you want it too. MyDOS will
pull a successful directory on SpartaDOS disks which usually results in
2 or three screens of garbage, a honk or two and then finishes up with
an impossible free sector count displayed at any point on the screen.
Yet register Y returns from the CIO call equal to 1 which means 'good'
so how would you know a bad one from a good one in machine code? If it
DID error out then I'm thinking you would want to format so the logic
you posted above is backwards? Don't feel bad as that is not an
unusual mistake to make when it comes to machine language in my
experiance. I don't think it will ever error out even with a ramdisk
full of garbage. And with the wrong configuration for the ramdisk in
use as well.

If you are looking just to insure that your ramdisk is drive 9 always,
you could place that value ($09) at $070A and just proceed with the
rest of your program. When you then format drive 9, MyDOS will sense
that drive 9 IS your ramdisk and proceed with the special code just for
the ramdisk format at that point.

MyDOS doesn't initialize the ramdisk, it could be configured to use one
and show one as valid and available when booted on a stock XL. If you
try to use it however, DUP.SYS will be overwritten and then you'll
crash, but you might not know it even happened because MyDOS will then
attempt to reload the DUP.SYS file from any and all drives in
succession eventually succeeding from your floppy and no appearent harm
done. The configuration of the ramdisk is totally a function of the
(O) Configuration menu option and then only good for the machine that

the option was run on. In order to save this configuration you MUST then do (H) Write DOS files menu option to drive one. THEN and only then MyDOS knows what kind of ramdisk you got when you then boot that disk on that particular computer. But the current configuration for your ramdisk always comes from the last time you ran the (O) Configuration menu option and nowhere else. MyRd2 fixes that problem and insures a working ramdisk configuration buy using code modified from those DUP.SYS ramdisk configuration routines.

I couldn't figure out any way to test for a valid pre-existing ramdisk if that is your goal. I had to cheat and make it a test for if MyRd had run before in order to prevent a 2nd and unwanted format of the ramdisk. And that was the only solution I could come up with. If I knew exactly what you wanted to do and when it was supposed to happen maybe I could help better? MyDOS is full of these kinds of twists and turns that seems to be built in such that you can't get there from here. Add to that, I don't know what you want to happen and we could go in circles for a long, long time. If you're just looking for basic MyDOS ramdisk info that's fine too.

Mostly right. The early Atari 800 used 6502B and the later 800s through the XEs used a 6502C. Only the processor board for the early 6502B has the extra circuitry you need to use a 65C02.

I have a 65C02 in one of my 800s. In my experience it does nothing but a little power saving unless you write your own code in assembler. I seem to recall my code was ~5% shorter using the extended instruction set. I've got in debates with people about the value of 5% tighter code. I think the ~5% speed gain you get is not significant but freeing up 500 bytes in the OS ROMs would allow you to add some nice features.

There was also the 65808 that is supposed to work in early 800s. This is a 16 bit internal/65816 pin compatible with the 6502B. I tried for a year to find one of these in every surplus shop in Silly Con Valley w/o sucess.Maybe we could scrape together a million bucks and get WDC to make another run.<grin>

Just a general comment to the group. Most people don't want to learn a new language like Action! or assembler. People that don't solder don't want to learn at this stage of their lives. What people seem to really want is a new power supply that will let their Atari run like a gigaHz P4.

Not sure, I never had to go any farther since Rich Dreher made the CFFA work on a IIplus. If I remember correctly, the RAM chips actually got hot with the C02 installed! It is entirely possible faster RAM would do the trick but it would just be easier to find an accelerator on eBay. Why risk frying a board.

Yes and no.

You will lose compatibility with programs that use the 6502's "illegal"
opcodes. That's less of a problem with Apples since the company switched
to 65C02 by itself before too many programs with the illegal opcodes
were on the market.

For other system architectures that stayed with the NMOS 6502's longer
and/or used lots of cycle-counted raster beam racing code, the problem
gets bigger. Examples would be the Commodore and Atari computers and
consoles.

And of course there is the problem that other people mentioned already:
Those systems that use NMOS 6502 *derivatives* (such as 6502B, 6507,
6510 etc.) can't use the 65C02 chips without some extra circuitry.

<snipped everything>

I read through your post, and understand and agree with what you are saying.
But, I can't help but think you must have completely misunderstood me.

Ok, you don't understand... First off, use MyDOS option O to set up the
RAMdisk, then option H to write to disk. From this point forward, everytime
you cold boot that disk, MyDOS will automatically set up the RAMdisk, but
won't format it. Without doing anything at all, you can pull up a directory
listing of D9:, and it works. But it reads the wrong sector count. On boot,
the RD appears as a disk with 65280 free sectors. All that is required is to
format it and you're ready to rock.

Now, since the drive is preconfigured at boot, you can pull up a directory
listing of D9:, read the free sectors and compare to 65280. If sectors <>
65280, abort format because something is wrong or the disk has already been
formatted. If CIOV returns with an error after trying to open the channel
for dir read, then the disk isn't present.

So, open for dir read, if error, abort format. If no error, get free sector
count. If sector count <>65280, abort format. Does that make sense to you
now?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

ATARIMANIA, http://www.atarimania.com/
Atarimania aims to offer a complete historical tour to the new or experienced
Atari user. From the company's humble beginnings to its demise as a hardware
manufacturer in the nineties, we hope to provide you lots of original content
in all forms: databases, catalogs, magazine scans and much, much more!

In addition to the unique material on the site, Atarimania also hosts a
massive on-going project: a gigantic database of ALL Atari 8-bit software,
complete with all the information you can dream of!

A few added details make a great difference, yes I do understand what
you are up to now, thanks. There is still a problem though. Under the
conditions you descibe above at boot up MyDOS is only preconfigured to
use the ramdisk, it has not been 'set up' at all. It will still pull a
directory on this ramdisk just as you say, but the value for your free
sector count is coming from random extended ram data that may not be
counted upon to exist each and every time you boot up. The data is in
a FF 00 FF 00 FF 00 pattern ($FF00 equals 65280) that often will skip

in other 256(128?) byte blocks of data with a 00 7F 00 7F 00 7F pattern depending on if it's Tuesday. Depending on humidity and the phase of the moon it seems, you CAN easily get different results. I've seen boot up ram patterns with the hi byte of the Ram's address existing in each 256 byte block, but never such that you could count on it. Your machine however may yeild the same numbers each and every time and that might go on for years. If that is the case and you don't mind it after learning where that boot up free sector count really comes from, then thumbs up, go for it as it will work just fine. But especially if you modify your computer in any way like later adding Omnimon OS, a MIO, even booting with a cartridge, you shouldn't be too surprised if the boot up extended ram patterns change drastically and then your program fails to work correctly.

I'm still thinking that you'll never get any error on a directory read as the MyDOS ramdisk driver never calls the SIO routines for any reason. The IOCB block and CIO routines are used, but that only to set up the target sector number and get that data moved to the SIO 'block' at $0300, from then on it's all done from the ramdisk driver code only. The ramdisk is also not accessable via any SIO calls whatsoever, thus no SIO errors are even possible. This is why the VTOC fix program for MyDOS does not work on the ramdisk as the program makes SIO calls directly. I did mention MyDOS twists and turns didn't I?

Best of luck.

you know about Microsoft DOS's FAT and Commodore 1541's BAM. What is it called for the standard Atari DOS 2.0, MYDOS and SpartaDOS? Atari ST ?

Thanks!
Jack

For DOS 2.0 and its derivatives, the closest analogon would be the VTOC
(volume table of contents, a bitmap defining the used sectors) and the
directory. There is no other name for the latter structure. The Atari ST
used AFAIK only a mildly modified version of the FAT system. DOS 3.0
was very much FAT like, too.

So long,
Thomas

<snip>

Yes he can, your Basic program works perfect here in creating a
suitable rom file for use in emulators or PC based eprom burners, good
job. Atari based eprom burners would need an appropriate file header
added to the OS.BIN file but that is no big deal. Now, if google
groups might let me see an email address to contact so that I might get
it too. Use BOSS in the subject line.
Lee_454*AT*yahoo.com

I may have it already but on my first attempt to find it, it's a no
show.
TIA

The C64 allowed 4 players as well, but two had to use the keyboard. The
copy of M.U.L.E. for the Atari that I have doesn't work on my 800 and my
800xl has defective keys and cannot play the game. I've won an auction
for another 800xl that is supposedly tested and working, but it hasn't
arrived yet.

Russ, I believe that the self-test is banked in at $5000. 54017 is $D301
(memory banking control) and 20480 is $5000.

```

Can you be more specific?

Which torrent? The name of the file should indicate the type of
compression software that was used.

Where did you get the torrent? That might help us.

Which bit torrent application did you use? on what platform?

Are you trying to run the actual .torrent file? That is just a
pointer for a Bittorent appl (simplied explanation). You need to get
a Bittorent App (Azureus is best IMO) and then use that to download
the file.

I've heard of this joystick swapping business and it turns me off. Also if your copy of M.U.L.E. doesn't work on your Atari 800 there's definitely something wrong with it. If you have the means to be able to do it, transfer the mule disk image from the downloads page on http://atarimule.neotechgaming.com to a floppy.

OK so this isn't to run on the Atari but will run with Azureus to download
an actual Atari file. OK .. I 'll try to Google for Azureus and read more
about the file type. Thanks for the quick responce..

http://gizmodo.com/gadgets/pcs/the-wonderful-world-of-casemods-163217.php

A kind reader sent in this cool cavalcade of case mods, including the Atari 800 mod, the Pokemon Laptop, and the famous Kana PC, shown here, which looks like its maker spends hours inserting and removing flash drives all over it.

We've seen these all, but it's fun to see them all in one place.

I wrote the same program according to his comments, though for some reason I
POKE'd 54017,127 trying to turn on a bit, and of course this activated the

self test. I noticed you POKE'd in 125, that must have been my problem. My ROM did end up working in the emu, just not the selftest. Cool, I'll have to do it again.

6218. 6502 bus timing for PBI device

Newsgroup: comp.sys.atari.8bit
Date: 2006-03-29 02:57:58 UTC
From: Preston Crow <pc-usenet05@crowcastle.net>
Message-ID: <pan.2006.03.29.02.57.57.200119@crowcastle.net>
Source record: 7225

As mentioned earlier, I'm looking at building a PBI device. I'm thinking of using a PIC18F4455 microcontroller connected to the bus. I'm concerned about whether this chip is actually fast enough, so I need to know the exact timings of the 6502's usage of the address bus. If it's fast enough, this single chip can read the signals on the Atari's bus, and emulate RAM and ROM, as well as provide USB connectivity. All for a five dollar chip!

How far into the cycle do I have to wait to read the address bus? The signal on PHI2 is low during the first half of the cycle. My understanding is that for memory reads, what matters is what is on the data bus at the end of the cycle (when PHI2 goes from high to low). How early can I trust the address to figure out what data to send?

If the chip in question isn't fast enough, they're announced some similar 16-bit microcontroller chips that should do the job, and I haven't looked to see what other companies are selling.

Also, if anyone knows where to get a 50-pin socket to build a PBI device with, that would be nice. I think the pin width is the same as for ISA sockets, so I'm thinking one option is to desolder some off of an old motherboard and then cut them down from 68 to 50 connections, but it would be much nicer to start with the right connector.

6219. Free stuff needs to go....

Newsgroup: comp.sys.atari.8bit
Date: 2006-03-29 03:37:27 UTC
From: Bob Stinson <bstin@shaw.ca>
Message-ID: <XhnWf.197512$B94.127179@pd7tw3no>
Source record: 7226

I've got a few items taking up space that need to go, but since they're possibly of some use to folks still using Atari 8bit, I don't want to simply throw them out, so I'm offering them here for nothing more than the cost to ship them.

Anybody interested in any, or all, of these items please contact me soon, because if there's no interest in approx. 2-3 weeks, I will resort to the dumpster, just to get rid of this stuff.

Here's what I have left, and the URLs of the pictures:

1.) Atari 600XL/800XL power supply. I just checked this with my multimeter, and it's putting out the correct voltages on the correct pins.

http://members.shaw.ca/bstin/Atari/Freebies/800xlPSU.jpg

2.) Dust Cover for Atari 800XL. I cut a hole in this, and sewed the edge of it so that I could leave my SpartaDOS X cart installed while also having the cover on the computer.

http://members.shaw.ca/bstin/Atari/Freebies/800xlCover.jpg

3.) Switch Box & Cable to connect the computer to a TV.

http://members.shaw.ca/bstin/Atari/Freebies/SwitchBox.jpg

4.) 800XL Case, keyboard, etc. This is the remains of my 800XL, i.e. I have the non-working motherboard(with no RAM chips on it) inside, as well as the shielding & screws, and the keyboard. If anybody wants just the keyboard, or any other part, I can pull the required item and ship just that.

Source record: 7229

Atari DOS 2.0s can be thought of as the foundation file system.

Many DOS's like 2.5, and SpartaDOS add extended functionality like
enhanced density support (2.5), and sub-directory structure (Sparta and
some others).

Most (all?) "superior" DOSs remain 100% backward compatible, however
DOS 2.0s will have some degree of trouble with disks from other DOS's.

Then we have DOS 3, which was closer to FAT in some regards, but Atari
quickly realised it was a mistake and DOS 2.5 was released after it,
and reverted back to the more compatible structure.

6223. Re: Dual Sided Floppy Disks?

Source record: 7230

The 1050 (and most other drives) only need the outside notch to go
double-sided.

There is no need for the timing hole, as it isn't used by the drive -
the timing is all software based.

Source record: 7231

Nice, but wouldn't it have just been a lot easier to use one of those "cassettes" which you can use in a car to hook up your walkman?

They're cheap as, and would probably do the same job.

Or better still, just spend $5 on parts and make the SIO2PC/APE interface.

Fair enough for trying though, my current hardware project is an interface to hook up PS1 memory cards to the 8-bit.

6225. Re: Soft and Hard Reset for the 800?

Newsgroup: comp.sys.atari.8bit

Source record: 7232

To have a 400/800 perform a reset like the XL/XE (ie recover from a lockup without losing your program), a modded OS would be required (as well as the "proper" RESET switch).

Fitting it within the 8K limit of the existing ROM should be no problem. Just use a 2 or 3 byte "magic" number and check it like on the XLs. Probably 20 bytes or so of program code.

Considering that the Atari runs at 1.7897725MHz (NTSC, slightly slower for PAL), that works out to about 558.73ns per cycle. So given the assumption that the spec is that the address lines are valid at the end of the first half of the cycle, the RAM would have to respond in half a cycle, which is 279.37ns. Make that 250ns to have a safety margin, and there you go.

At least the math works out right.

I must be missing something. I thought the XL Boss was an 800 replacement OS. Why wouldn't you just open the channel to the disk file; then PEEK the entire XL OS area ($C000-FFFF); and PUT each byte to the disk file as they are PEEKed? Why the concern over the banking code for an 800 OS?

Hopefully someone knows about SCSI error codes...
I am trying to set up a new hard drive with my BB (Parity mod is
installed).
I have correctly entered the drive data. The configuration data
appears to be correctly written to Sector 0. But when I select the
controller (SCSI embedded drive) there is a long pause and then I get
the following error message/codes from the HDFMT.COM (the BB
formatter):

"Mode Select Command Failed!"
"70,26 is the error code."
"05 is the sense key."

Any thoughts/suggestions?

Thanks,
Larry

Atari 1053 was a double-sided double density floppy drive for the XL before XE's XF551. XF551 uses IBM style drive mechanism. right? So 1053 uses IBM's drive? but why was it never released?

Thanks!
Jack

The XF-551 was made by Atari and was double side/double density.

Atari was allegedly concerned about reliability in DD, and probably
with good reason. For that era of drives, DD was/is much more
difficult to make consistently reliable. Most any Atari drive in good
condition will read most any other Atari SD disk. That can't be said
of DD. My own experience with Rana, for instance, was many would not
even read their own disks in DD, let alone disks from on other drives.
So Atari "split the difference" electing to go with MFM, but 128 byte
sectors. As it turned out, the 1050 (and at least its Tandon
mechanism) was reliable enough for DD. Indus, too. If you want to
better understand the perils, pitfalls, and other problems with drives,
read "Beneath Apple Dos." Excellent and understandable, too.

>...So 1053 uses IBM's drive? but why was it never released? <

No, AFAIK the 1053 was to use a Tandon mech, with electronics still based on the 6502/WDC families. Same for the 1055. Why didn't they get released? Atari was bleeding red ink heavily at that time. Many things were cancelled. With new mgt., cutting cost was the order of the day. Some of the tests for any company that intends to stay in business is "can we make money developing and selling this product?" and "do we have the funds to put it into production?" and "is there a cheaper alternative?" At any rate, the XF551 (and its sibling the XF351) were clearly cheaper to produce (look at the boards and the component counts).

IMO using a microcontroller and doing all the interfacing in software
isn't a good idea. You'll run into all sorts of problems with it.

Better use a CPLD (Lattice iM4A5, Altera, Xilinx). You can easily
use one of the free development tools and write the interfacing
logic in VHDL (or Verilog, Abel or whatever hardware description
language you prefer).

Here are some important hints if you want to do this for the Atari PBI:

A lot of Atari XL/XEs don't meet the official timing specification.
Usually, the address and data lines should be valid for some time
(10..30ns) after the falling edge of PHI2 (that's the point where
writing to memory occurs). But Atari really built quite a lot of
garbage (especially in the end of the 8-bit area) and so you have
to take care of that fact (otherwise your hardware just won't
work correctly). With the old, slow chips in the 80s this wasn't
a big problem, but the modern, fast, chips will go crazy.

Protecting the address lines is easy: all modern CPLDs contain
a programmable latch on the input line. So just activate it and
latch these input lines with PHI2=high. According to the 650x
timing specification the address lines must be valid some time
before the rising edge of PHI2 and must not change while PHI2
is high.

BTW: it isn't a bad idea to protect the R/W line in the same way.
On the XL series, the LR/W line on the PBI is already protected
internally by a latch (but not the R/W line on the cartridge port),
but on the XE series there's no such protection.

When protecting the data lines, we have to distinguish between
read and write cyles.

Read cycles (memory to CPU transfers) are not critical. The Atari
CPU is so damned slow, it won't notice if the data lines are
already invalid some ns before the falling edge of PHI2. This is
also the reason why the "stabilizing the XL/XE mod" actually works
(it doesn't shorten only write cycle timing, but also read cycle
timing).

Write cycles are very critical. If the data lines are invalid
at the falling edge of PHI2, wrong data is written to memory.

If the address lines are invalid, data is written to the
wrong location. => Ouch!

The easiest way to fix write cycle timing is to shorten the time
when PHI2 is high: Use a 74HCT123 with R=5k6 C=33pf, connect A
to GND and B to PHI2 and use this signal for write timing (instead
of PHI2). The HCT123 generates a single pulse with pulse high time
depending on R and C after the rising edge of PHI2. The non-inverted
output (Q) now just looks like the original PHI2 signal, but with
and earlier falling edge.

Voila, rock-solid timing and you don't need to do any modifications
inside your Atari!

so long,

Hias

As Larry said: Actually if I have it right, Atari had problems even getting any drive to work. I'm not sure about which models but I am pretty sure that at least one, like the 1050, was developed out of house by an outfit like Tandon. At any rate, the 'not invented here' drive won out when the in house drive failed. Compare the rock solid PC board, shielding, etcetera, of the 1050 to something like the PC board made out of saltine crackers in and flaky connectors in the XF551 to see what we probably would have got from Atari.

I think I recall Bill Wilkinson saying the cost of the in house drives like the 815 was so high that you could buy 2 1050s for the same price. I imagine the 810 was an expensive drive to manufacture too and thus the incentive to replace it.

The 1050 enhanced density is double density. Double density refers to the bit density, ~bits per inch, laid down on the disk. There were all kinds of single and double density formats back then.

Atari was limited in that they only had 256 bytes of RAM in a 6810 and a PIA type chip. Can't exactly have a 6502 stack and still have 256 bytes available for a write buffer. The XF gets away with it because the different chip, 8052<?>, has a lot of general purpose registers that can be used for storage of variables and what not.

I am of the opinion Atari would not have given us a drive with a lot of ram in it even though it made sense. For one thing, you would only need to add a single command to the ROM to get a drive that could defeat a lot of copy protection schemes. Just something simple like load RAM with code then JSR to it.

6245. 130XE released but still 1050 ???

In 1985, 130XE and 64XE were released, 1050 should be replaced with XE's style drive but still have XL's style ? Like Commodore 64C and 1541C's white style as C128 have a match... When I bought 130XE, I was waiting for new XE's style drive but it was never released until 3 years later. How Come?

Thanks!
Jack

My 1050 had (c) Tandon on the EPROM sticker.

http://homepage.ntlworld.com/kryten_droid/Atari/800XL/1050/1050/1050_FDD.htm

There is RAM in the 6810 (128 bytes) and the 6532 (128 bytes RAM, I/O,
Timer) chips.

http://en.wikipedia.org/wiki/6532

I copied a 'disk doubler' using a spare 6502, EPROM and a 2K RAM (6116).
It would be easy for me to fit more RAM than the Atari 800 had :-)

Probably because of the cost, like everything else. Interestingly, there is a picture of a never-released 1050 in XE styling on the back of the 130XE box.

ICD sold the "US Doubler" 1050 upgrade that moved the drive up to full
double density. IIRC, it consisted of a replacement controller chip and
it seems like you had to check a jumper position. I had a drive with
that upgrade, as well as a couple of Indus drives and a couple of
XF551s. None had any trouble reading disks created with the others. (As
long as you stuck with single-sided in the XF, of course.) I used MyDOS
almost exclusively with my DD disks, if that makes any difference.

2006.02.15 MadTeam extensive update

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Active" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, should NOT be listed here.
```

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the

information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!
